H & G Die Heads

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

THE BICKNELL-THOMAS TAPPING ATTACHMENT

Fits Any Make Drill

A friction mechanism inside the body of the attachment is automatically adjusted by the driving-pressure, creating a very sensitive drive and eliminating the sudden strain of the reverse—responsible for many broken taps. This attachment is fitted with a plain chuck with jaws that grip both the round and square end of the tap shank.

Made to take taps from 3-32" to 1-4" in diameter.

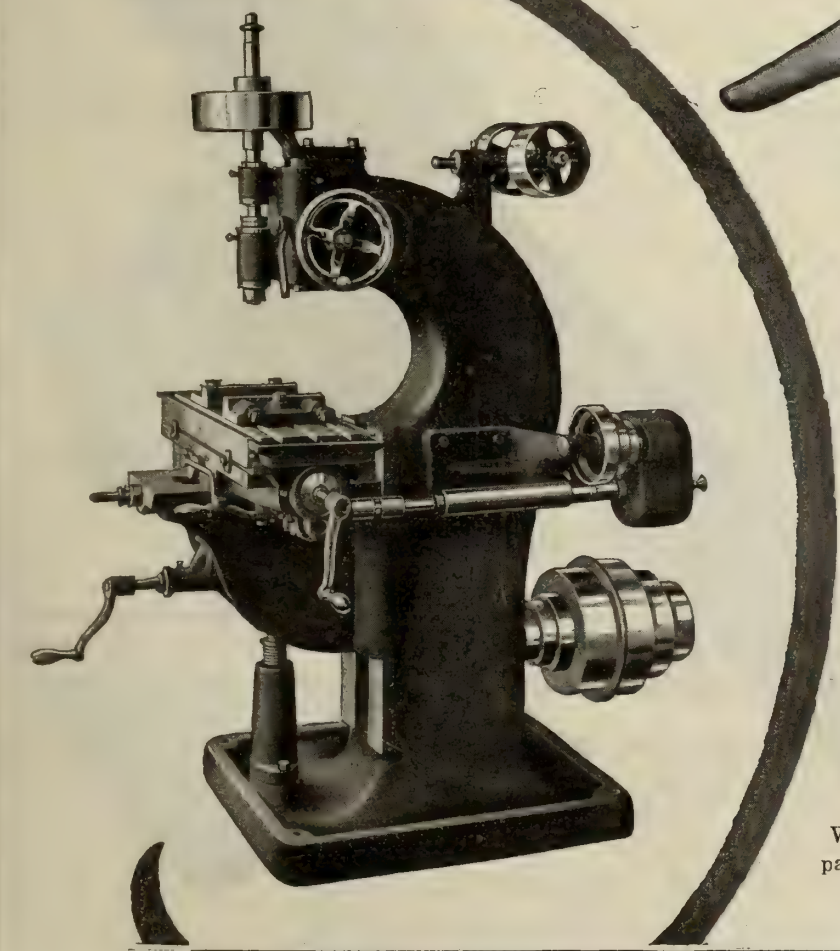
BRISTOOL

Bristol Vertical Milling Machine

A Tool of Large Capacity



Ball Bearings are used at the most important points making it a free running tool, which, combined with its being a belt-driven machine, makes it capable of turning out work on which an extra smooth finish is desired.

The longitudinal table feed is controlled by the gear change box which gives six different feeds for each change of spindle speed. A stop to gauge with micrometer adjustment is used on the head to regulate the depth of cuts.

Learn all about its production capacity.

Write for bulletin giving fuller particulars.

If interested tear out this page and place with letters to be answered.

To cut down the cost per cut

Put on the Weight

If you're cutting with a medium or heavy power machine, start out with a good, full, 45-pound pressure after the first two or three strokes. As the number of cuts progresses, increase your weight. Remember that once the first keenness of the blade is gone, the heavier gauge of the blade the greater the pressure required to make the teeth "bite." Too little weight will ruin a blade almost as quickly as too much.

Follow the Starrett Hack Saw Chart in selecting your blades. Put on the weight and watch the cost per cut go down.

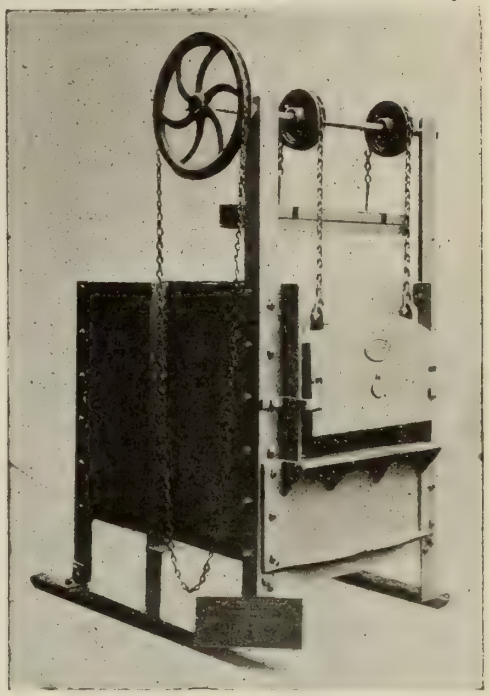
Do These Advantages Appeal

To Your Sense of Economy and Efficiency?

OIL FURNACE
VERSUS
COAL FURNACE

It's economy — requires one-half the space; costs less than half; no chimneys or flues required; instantaneous and perfect control of temperature; higher temperature obtained; no coal ash handlers required; no coal or ash piles; less waste of fuel, because it is shut off instantly; requires much less time to get the required heat. *Can you afford to lose the Advantages of this oil Furnace?*



Write To-day for Full Particulars.

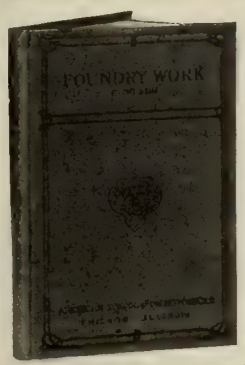
Mechanical Engineering Books

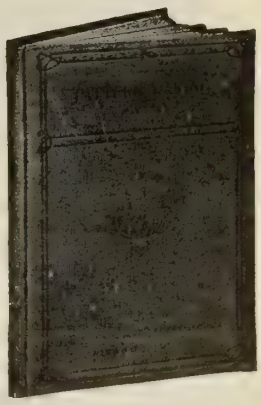
If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

MACHINE-SHOP WORK. By **Frederick W. Turner,** Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price $2.00

MECHANICAL DRAWING. By **Ervin Kenison, S.B.,** Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.25

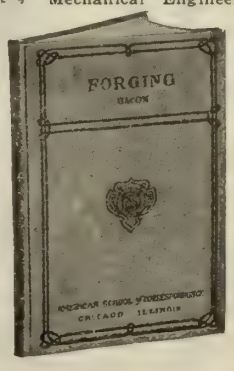


FOUNDRY WORK. Revised by **Burton L. Gray,** instructor in Foundry Practice, Worcester Polytechnic Institute. 224 pp., 191 illus. Cloth binding. A practical handbook on standard foundry practice, including hand and machine molding, cast iron, malleable iron, steel and brass casting, foundry management, etc. Includes use of various types of molding machines. Price, $1.25



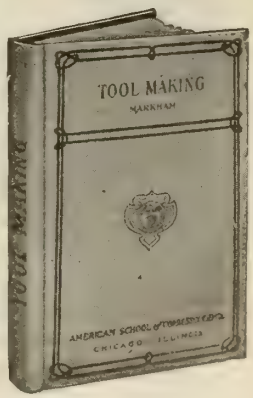
PATTERN MAKING. By **James Ritchey,** Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price.....$1.75

MACHINE DESIGN. By **Charles L. Griffin, S.B.,** Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price ... $1.75



FORGING. By **John Lord Bacon,** Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.25

TOOL MAKING. By **Edward R. Markham,** Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers. Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.75



Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

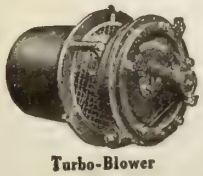
No. 150—Sturtevant Fuel Economizers
256—Steam Turbines
239 Vertical Single Cylinder VS-7 and VS-8
195—General Catalog
213—Power Apparatus
225—Air Washers Type S



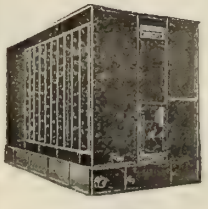
Turbo-Blower

Direct Current Motor

B. F. Sturtevant Company of Canada, Ltd.

Factory and General Office: Galt, Ont.

Montreal Toronto Winnipeg



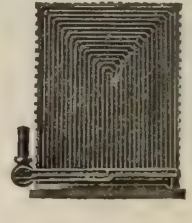
Type H Air Washer

Fuel Economizers

Sturtevant (TRADE MARK)

PRODUCTS

VS-7 Steam Engine



Heater

If what you need is not advertised, consult our Buyers' Directory and write advertisers listed under proper heading.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

ABRASIVE MATERIALS
Aikenhead Hardware Co., Toronto, Ont.
Brantford Emery Wheel Co., Brantford.
Canadian Fairbanks-Morse Co., Montreal
Geo. F. Foss Mchy. & Sply. Co., Montreal
Ford-Smith Mach. Co., Hamilton, Ont.
Norton Co., Worcester, Mass.
Plewes, Ltd., Winnipeg, Man.
Pittsburgh Crushed Steel Co. Pittsburgh.
Rice Lewis & Son, Toronto, Ont.
Williams & Wilson, Ltd., Montreal.

ACETYLENE
Carter Welding Co., Toronto, Ont.
Prest-O-Lite Co., Inc., Toronto, Ont.
Union Carbide Co., Toronto, Ont.
Welding & Supplies Co., Montreal, Que.

ACETYLENE GENERATORS
Prest-O-Lite Co., Inc., Toronto, Ont.
Welding & Supplies Co., Montreal, Que.

ACORN DIE AND HOLDERS
Greenfield Tap & Die Corp., Greenfield.
Wells Bros. of Canada, Galt, Ont.

ACCUMULATORS, HYDRAULIC
Canadian Fairbanks-Morse Co., Montreal
Garlock-Walker Mach'y. Co., Toronto.
Metalwood Mfg. Co., Detroit, Mich.
Niles-Bement-Pond Co., New York.
Williams & Wilson, Ltd., Montreal.

AIR COMPRESSORS
See Compressors.

AIR CYLINDERS
Smalley-General Co., Bay City, Mich.

AIR RECEIVERS
Can. Ingersoll-Rand Co., Sherbrooke, P.Q.
Dominion Bridge Co., Montreal, Que.
MacKinnon Steel Co., Sherbrooke, Que.
St. Lawrence Welding Co., Montreal.
Williams & Wilson, Ltd., Montreal.
Welding & Supplies Co., Montreal, Que.

AIR WASHERS
Can. Blower & Forge Co., Kitchener.

ALUMINUM
Canada Metal Co., Toronto.
Tallman Brass & Metal Co., Hamilton.
Williams & Wilson, Ltd., Montreal.

ALLOY, STEEL
Armstrong, Whitworth of Can., Montreal.
Blancke Co., L. C., New York City.
Boker & Co., Inc., H., Montreal, Que.
Firth & Sons, Thos., Montreal, Que.
General Steel Co., Milwaukee, Wis.
Hawkridge Bros. Co., Boston, Mass.
Kayser-Ellison & Co., Ltd., Montreal.
Norton, Ralph B., Agent, Montreal.
Pilot Steel & Tool Co., Montreal, Que.
Swedish Steel & Importing, Montreal.
Vanadium Alloys Steel Co., Pittsburgh.
Vulcan Crucible Steel Co., Aliquippa, Pa.

ANCHORS
Fellows Bros., Ltd., Chadley Heath, Eng.

ARBORS
Brown & Sharpe Mfg. Co., Providence, R.I.
Canadian Fairbanks-Morse Co., Montreal
Cleveland Twist Drill Co., Cleveland.
Ford-Smith Machine Co., Hamilton, Ont.
Wilson & Co., J. C., Belleville, Ont.
Garlock-Walker Machinery Co., Toronto
Morse Twist Drill & Mach. Co., New Bedford, Mass.
Pratt & Whitney Co., Dundas, Ont.
Whitman & Barnes Mfg. Co., Akron, O.
Williams & Wilson, Limited, Montreal

ARCHITECTURAL IRON
Page Steel & Wire Co., Adrian, Mich.

ARRESTERS, DUST
Northern Crane Wks., Walkerville, Ont.
Pangborn Corporation, Hagerstown, Md.

AUTOGENOUS WELDING AND CUTTING PLANTS
Carter Welding Co., Toronto, Ont.
Prest-O-Lite Co., Inc., Toronto, Ont.
St. Lawrence Welding Co., Montreal
Welding & Supplies Co., Montreal, Que.

AUTOMATIC MACHINERY
Baird Machine Co., Bridgeport, Conn.
Garlock-Walker Machy. Co., Toronto.
Gardner & Son, Robert, Montreal.
National Acme Co., Cleveland, Windsor
Pratt & Whitney Co., Dundas, Ont.

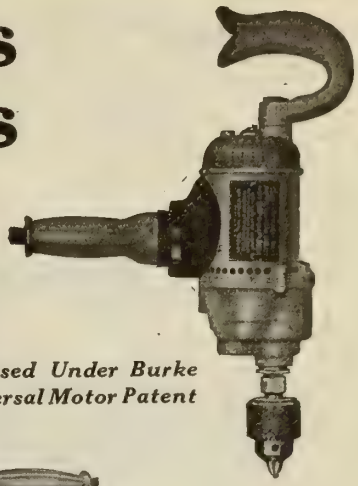
Thor

Electric Drills and Grinders



The only Electric Tools equipped throughout with ball and roller bearings.

Light, Powerful and Durable.

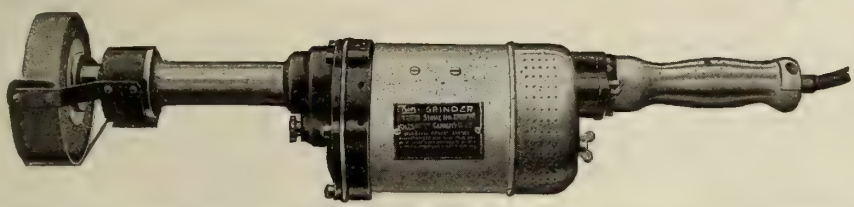
Thor Electric Tools have off-set spindles—which permit operating in close quarters—a variety of speeds, S K F Ball Bearings, four contact switches, D.C. or Universal Motors and several other features that make them the super-tools of the day. Jacobs Chucks used as Regular Equipment.

Licensed Under Burke Universal Motor Patent

PORTABLE ELECTRIC GRINDER

Equipped with Universal Motor for Operating on Direct or Alternating Current

110 TO 250 VOLTS



It will pay you to put them to the test and let them prove that they'll reduce your production cost.

For Full Particulars Write—

Independent Pneumatic Tool Company

334 St. James St., Montreal

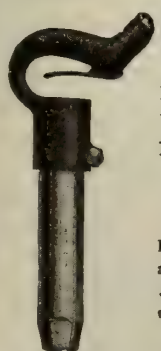
Toronto: 32 Front St. W.
Winnipeg: 123 Bannatyne Ave. E.
Vancouver: 1142 Homer St.

Cleveland Sand Rammers

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts — Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.



CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Standard Equipment Everywhere

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock:—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Write for Bulletins, 34A, 41 and 43.

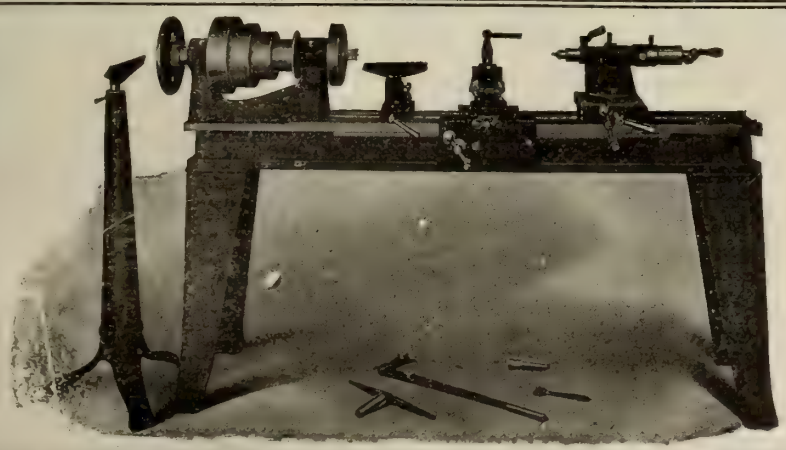
BABBITTS

Hoyt Metals have been used with great success for many years.
Put them to the test and you'll soon see a difference in your babbitt cost.
All elements entering into our mixtures are carefully refined and put together in such proportions and in such relation to each other that the best possible alloy is secured for the work for which it is designed.
Annual sales over $5,000,000.

Hoyt Metal Co., Toronto

New York, N.Y. London, Eng. St. Louis, Mo.



A Favorite—

Blount Pattern-makers' Lathe

FAST AND ACCURATE—Equipped with set over swivel tailstock and carriage, and outside face plate and tripod. Built in 16" swing with beds 6 or 8 feet in length. Spindle is made of high carbon steel, is hollow and fitted with Morse Taper and runs on self-oiling bronze bearings.
Our catalog gives a full description of this strong and highly efficient machine, also our other quality speed lathes and grinders. Give us your address.

Steel Products

Open Hearth, Basic and Acid, Electric and Alloy Steels

Castings

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons

Railway Specialties

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears

Forgings and Billets

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings

Plates

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon
Automobile Plates and Sheets

Agricultural Steel

Soft Center and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades

Williams' "Vulcan" Drop-Forged Safety Lathe Dogs

DESIGNED to insure the maximum of safety, care was taken to provide a form as close to a circle as possible—no bunching or extension of the head portion, no "sleeve-catchers" to cause injury to the unwary operator.

They provide safety complete and automatic, and with this assured safety, better balance on the lathe and every whit of utility obtainable in this class of tool. The price is the same as for the dangerous kind.

Bent and Straight Tail, 1 or 2 screws, 16 sizes, 3-8 to 6 inch capacities.

Ask for your copy of our new catalog.

J. H. Williams & Co.

LEVIATHAN AND ANACONDA
10 ST. PETER STREET,
MONTREAL.

Gentlemen:- Sept. 25th, 1919.

You will be interested to know that we will shortly have off the press our new 150-page reference work on Power Transmission, Conveying and Elevating.

This book is, throughout, the production of technical experts of broad, practical experience. No time or expense has been spared to make it the most complete and useful reference work of the kind ever issued in Canada.

It is profusely illustrated with reproductions from actual photographs and original drawings, and contains a number of carefully prepared rules and tables for the information and guidance of belting users. Contents are conveniently arranged, and a comprehensive index is included.

The volume is printed on fine paper and is substantially bound, de luxe, loose-leaf style. Our aim has been to make this a valuable and permanent addition to any manufacturer's office library.

I will be pleased to forward you a complimentary copy, carrier charges prepaid, upon receipt of your request on your firm's stationery. The edition is limited.

Very sincerely yours,
MAIN BELTING COMPANY of CANADA, LIMITED.
D. E. Parker
Managing Director.

A REAL GUARANTEE

Our responsibility for each LEVIATHAN and ANACONDA Belt extends beyond payment until the belt has earned in actual service its full cost as compared with the service of any other belt of any kind, under the same or similar conditions, barring accidents.

We regard this as the only guarantee that is fair to the buyer.

The Canadian Who Bullied the Bolsheviks!

WHEN war broke out, Colonel "Klondyke" Boyle took across, at his own expense, 200 staunch Yukon volunteers. He was sent to Southern Russia, and in six weeks turned the transport system there from chaos into efficiency. He fed the starving Russian and Roumanian armies. He arranged temporary peace terms between Bolsheviks and Roumanians. Aided by twenty Chinese murderers and a brave Canadian girl, he bluffed the Bolsheviks and Austrians, in a tremendous exploit which won for him the title "Saviour of Roumania," and the personal thanks of the Roumanian royal family.

Read this story of "Klondyke" Boyle, by Arthur Beverley Baxter, in September MACLEAN'S—it starts on page 13.

"Growing Under Gouin"

—tells the amazing story of development of Quebec Province during the past fourteen years —in road-building, finances, industries and education.

"Meet Mr. Habitant"

—What does the rest of Canada know about the Habitant of to-day? Does he talk like Drummond's poems? This article, by Thomas M. Fraser, forcibly depicts the assets Canada has in French-Canadian stability and thrift, and will go far to remove any lingering prejudices which may exist in some minds.

Other Big Features

The Crowning of the King—By J. K. Munro, the pungent, pithy, political pundit.

Nuorteva's Propaganda—By C. H. Cahan, K.C., recently Director of Public Safety.

The White Eagle at Niagara—By Major C. R. Young, late adjutant Polish Army Camp.

The Problem of Our New Canadians—By Nellie McClung.

His Majesty's Well-Beloved—By Baroness Orczy.

Canada's Great National Asset—By D. B. Hanna, president Canadian National Railways.

Teddy Bear—A wonderful, poignant, Robert W. Service poem.

On Leave—A light, frolicsome story by Harry Bailey.

Evil Spirits—Another Bulldog Carney story, by W. A. Fraser.

Ebb and Flow—A new story by C. W. Stephens, who wrote "Man and Wife."

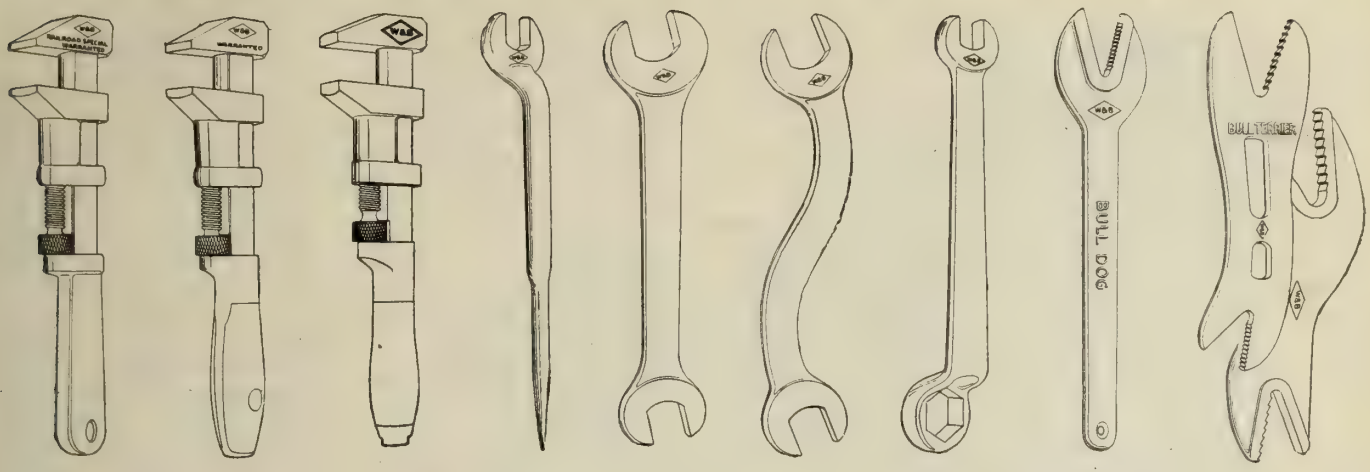
Why "W & B" Wrenches?



W&B
TRADE MARK

Canadians-on-the-job are doing their work with Canadian-made wrenches bearing the "W & B" Diamond Trade Mark and made in accordance with this principle:

"Make it better than anyone else can make it, put your name on it and stand by it."

The Purchasing Agent

says the prices are right for the quality, shipments are prompt, the assortment is the most complete made in Canada, and he can fill his wrench requirements in one order, saving shipping charges and office details, and simplifying handling of materials. Besides, the men like to use "W & B" wrenches since they last longer than any others.

The Production Manager

says he can get more work out—less time per nut tightened—with "W & B" wrenches. Says they fit the nut snugly and hold their shape better.

The Man-on-the Job

says he feels safe with a "W & B" wrench. He says the fit is clean and the jaws won't break or spread, no matter how hard the pulling may be.

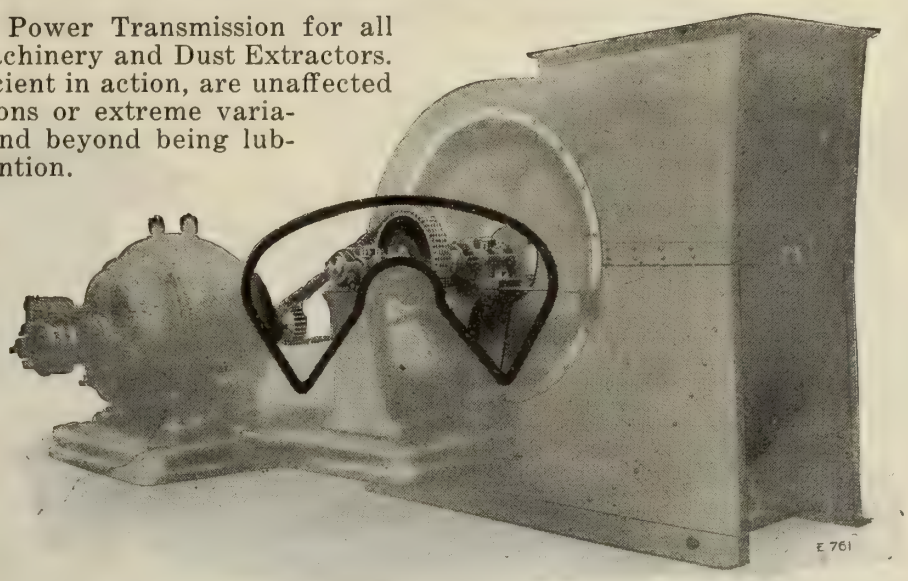
"The Coventry" Noiseless Chains

are the ideal form of Power Transmission for all kinds of Ventilating Machinery and Dust Extractors. They are silent and efficient in action, are unaffected by atmospheric conditions or extreme variations of temperature, and beyond being lubricated, require no attention.



A 25" Keith fan, driven by "The Coventry" Noiseless Chain Motor of 7½ h.p., running at 950 r.p.m., fan 400 r.p.m. This illustration shows how floor space is saved by using chain transmission.

"The Coventry" Chain Company, Ltd., Coventry, England

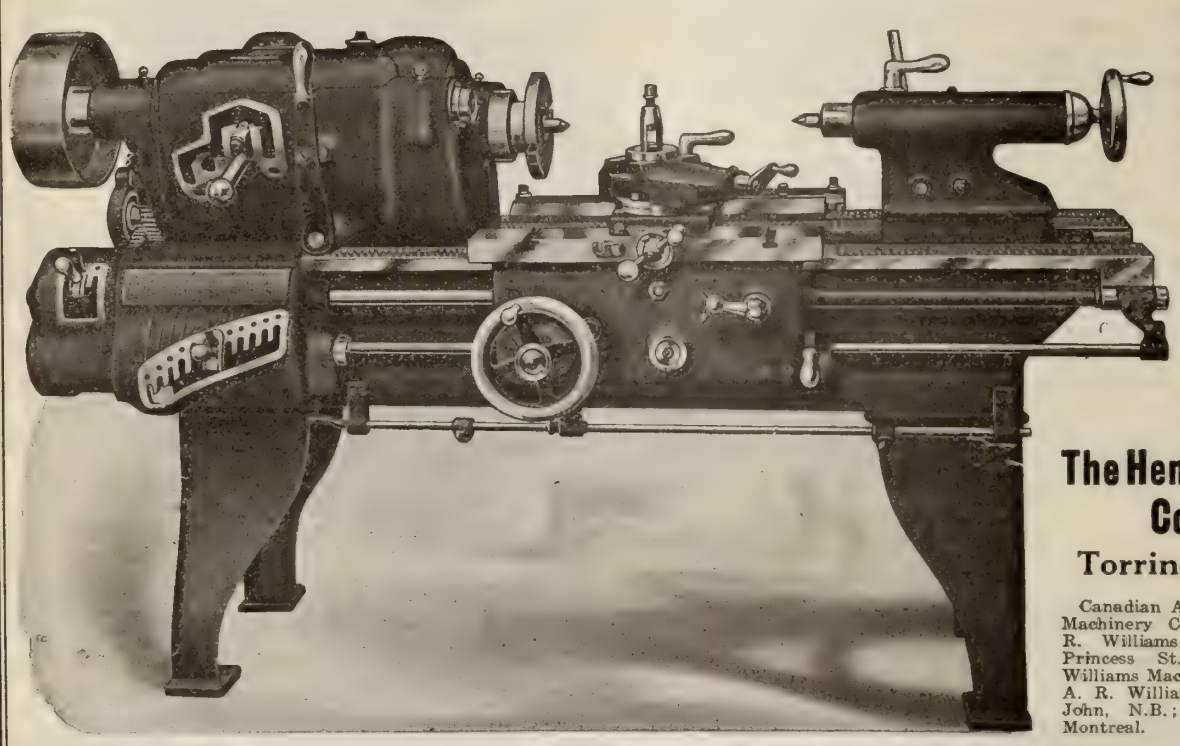
HENDEY 18-inch GEARED HEAD LATHE

8 mechanical changes of speed for spindle with driving shaft running at constant speed, 4 direct and 4 through back gears.



36 DIFFERENT THREADS AND FEEDS are had through Mounted Change Gearing, each change being quickly made through controlling handles in Gear Boxes.

BEFORE PURCHASING A NEW LATHE INVESTIGATE THE HENDEY SERVICE.

WE'LL HELP YOU BY FURNISHING LIST OF USERS.

Write for descriptive circular.

CUTS THAT SAVE
Time, Labor and Money
by using the
WALLACE BENCH SAW

Portable

Quickly Adjusted

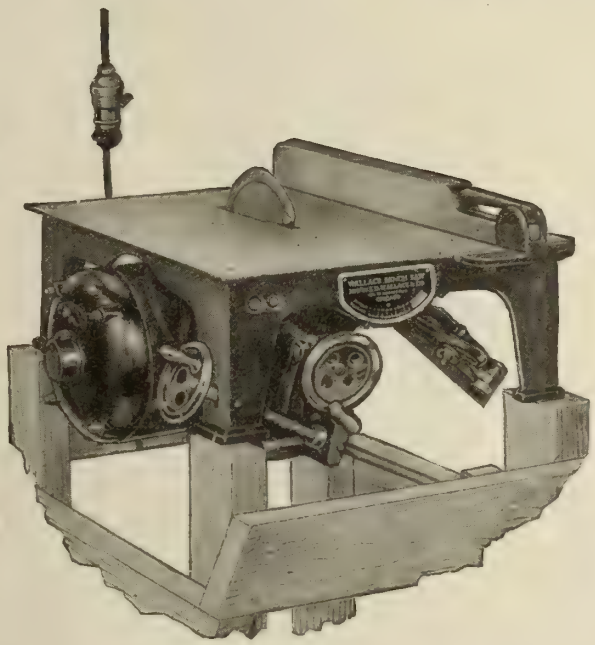
Universal Type

Dynamically Balanced

Cuts 45° Both Ways at One Time

Avoids Spoiled Work

Saw Tilts Instead of Table



Cuts at Any Angle

Cross Cut or Rip

Driven by ½ H.P. Motor, Either Alternating or Direct Current

Handles 80% of Your Cutting Work at Minimum Cost

It's *the* Saw That Every Keen Management Has Been Looking For

SPECIFICATIONS

Diameter of Saw	7 Inches
Size of Table	17 x 20 Inches
Size of Motor	½ Horse Power
Weight of Saw, Including Motor	115 lbs.
Shipping Weight	150 lbs.
Speed of Saw	5,200 R.P.M.
Height—Foot to Table Top	6⅞ Inches
Height—Including Stand	36 Inches

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material. Motto: **"Quality and Service."**

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

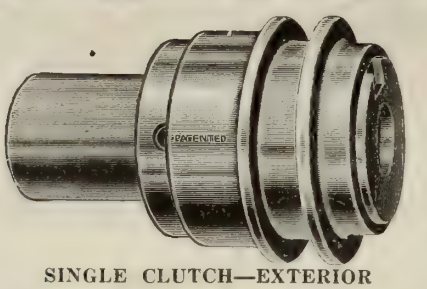
Manufacturers of a paramount line of Twist Drills, Reamers and Milling Cutters

THE JOHNSON FRICTION CLUTCH



SINGLE CLUTCH—EXTERIOR

THE SIMPLEST WAY—AND THE BEST

In a clutch or any other mechanical device, unnecessary complication means trouble. Make a single part serve where two have been used before, and you have reduced by one-half the places that can break, wear or get out of adjustment. Put the cost of *extra* material into *better* material, and you have doubled the length of service.

In the Johnson clutch, this idea has been followed out to its practical limits. The result is a model of simplicity in clutch construction—a few sturdy parts, each correctly built and accurately tested for the duty it must perform. This lack of complication means continuous service and low maintenance cost. Johnson Friction Clutches stay on the job.

War Record Not Made Public

The "Whitney" Special Quality "Type M" Chains

made a great showing during the war years 1916-7 and 1918.

Our tests and demonstrations were made on prominent 8-cylinder motors in service on a large number of cars in the State of Connecticut.

During this long period not a single "Whitney" Chain or Sprocket had to be replaced and the condition of every Drive has been pronounced remarkable.

One Drive recently examined had given over 35,000 miles' service and both Chains and Sprockets were in such perfect condition that they appeared good for more than double that record (Sprockets having no adjustment).

The links of this SPECIAL CHAIN have finished faces and reamed holes, and the smooth faces do not damage the Sprocket teeth.

Our war contracts were such that we did not announce this SPECIAL CHAIN until after the conflict was over.

No. 4

Of a series of Technical Talks on Ball Bearings

THE top diagram shows the rigid type hanger and standard type radial bearings, and also a ball bearing loose pulley. The point of interest in this application is the use of rigid hangers, which is made possible by the self-aligning feature of the SKF Ball Bearings. The shaft is turned down at each end to form a shoulder against which the bearing is locked by a nut. Felt grooves are provided on the inner side of each housing and end caps on the outer sides. The outer race of one bearing is rigid in the housing to take care of the end thrust and the outer race of the other bearing is free to "float."

The application shown in the centre drawing is similar to the one described above, except that the hangers are adjustable. Plain radial bearings are used and the shaft turned down at each end as in the above application.

The lower diagram shows SKF adapter type ball bearings mounted on a countershaft with standard type hangers. The housing is held in the frame by four adjusting screws and has felt washers for retaining the lubricant and excluding dust or dirt, etc. Set collars are used for taking care of the side play.

For loose pulleys the ball bearings, two in number, usually 1200 series, are mounted on a sleeve which is clamped to the shaft by means of a set collar. The bearings are mounted against shoulders on the sleeve the necessary distance apart, the inner race being held firmly in position by the two end caps. The housing is dust proof and provided with a filling plug for grease.

SKF Ball Bearings are also used in clutches, jack shafts and idlers, the method of mounting for idlers being very similar to that employed for loose pulleys and the same series of bearing usually used. In clutches, adapter type ball bearings are usually employed, although radial bearings can also be used. In the latter case the bearings are mounted on a sleeve and locked in position by nuts.

The advantages of the above applications are apparent, as countershafts usually run at high speed and the elimination of friction, saving in lubrication and attention are important factors. The application to the loose pulley is worthy of special notice, as the pulley revolves round a stationary shaft. In plain bearings this causes the lubricant to leave the point of lubrication through centrifugal force, with consequent heating and seizure. In the case of the ball bearing pulley, the oil or grease is flung against the outer chamber which is the point of lubrication, thus preventing the bearing running dry and heating.

ELECTRITE

High Speed Steel

SEVERAL factors combine to make this high-speed steel a triumph of the steel-maker's art; Electric Furnaces — entirely infallible, automatically regulated, delivering the same result time after time.

Uranium — This rare element, cousin to Radium, effects a profound change in the texture and quality of the steel.

Added to these, the constant care and skill of years of steel-making experience make the result of each melt a foregone conclusion.

Latrobe Electric Steel Co.
LATROBE, PENN.

URANIUM

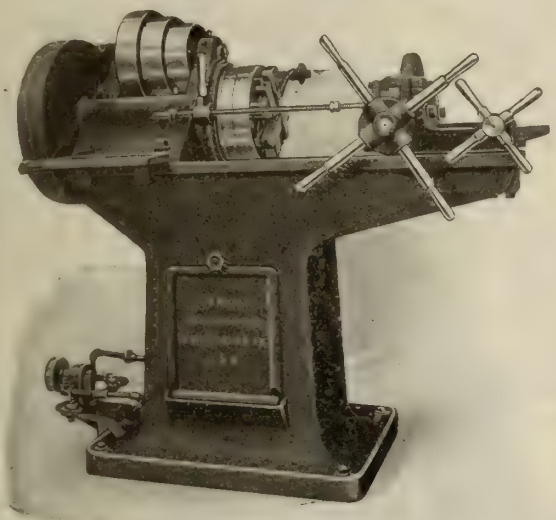
NOTHING BUT A LANDIS WILL DO

When you consider the purchase of a threading machine and the superintendent wants one that is speedy, reliable and economical—it can only be a Landis.

These facts may be helpful in coming to a decision.

Long life of chaser which exceeds that of any other die by twenty times at least.

Variable rake angle which permits of a grinding suitable to the material being threaded.



No annealing, hobbing or retempering, a slight grinding at the cutting edge renews the die.

Right and left hand threading with the same set of chasers.

Don't consider the intial cost of a threading machine all important; it's the cost of die upkeep that makes it expensive or economical. That is why the Landis may cost you a little more—the upkeep of the chaser is almost negligible compared to other dies.

Study the Other Features in Catalogue No. 24.

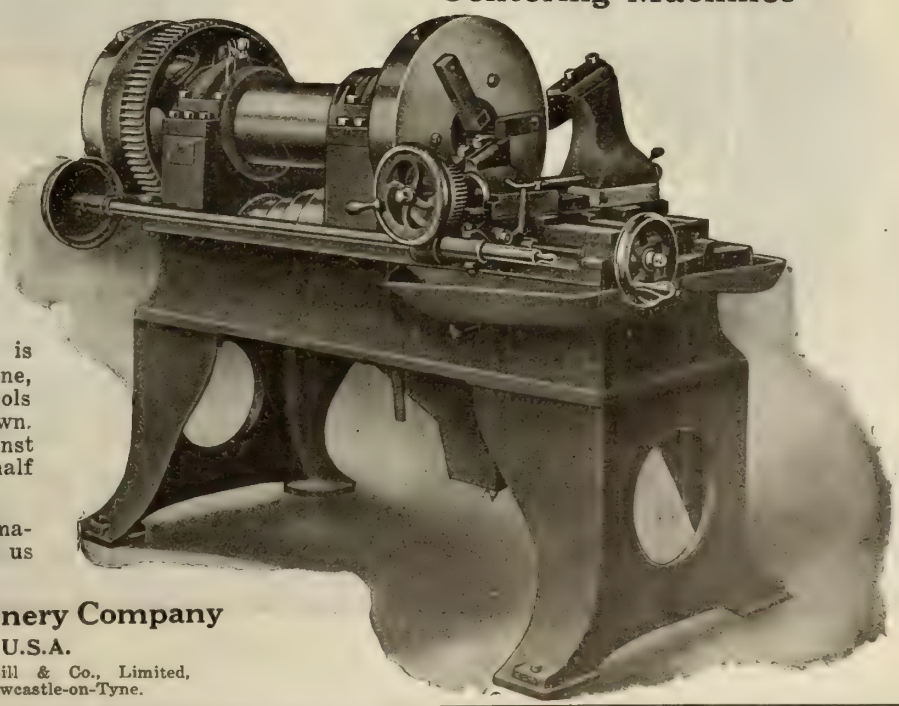
Cut Your Cutting-off Costs in HALF

HURLBUT'S

Patent Cutting-off and Centering Machines



TO say that the Hurlbut, Rogers Cutting-Off and Centering Machine will **double your production** and **cut your costs in half** may seem like a broad claim. But this is just what this machine will do compared with any ordinary machine of its kind.

Hurlbut, Rogers speed and efficiency is easily explained. Instead of only one, it is equipped with two cutting-off tools —one cutting up and the other down. In this way they hold the work against each other and finish a job in just half the time and do twice the work.

You can't afford to be without this machine. It saves real money. Let us tell you more about it. Write!

OVER 1000 INDUSTRIALS USE

GOODYEAR
MADE IN CANADA
EXTRA POWER BELTING

ON RECORD in our offices alone are the names of over 1000 Canadian industrials who are satisfied users of Goodyear Extra Power Belting.

A vast hive of industry, giving employment to thousands upon thousands of men. Engaged in every form of industrial activity known in the Dominion. Turning out millions of dollars' worth of Canadian products every year.

What an overwhelming endorsement of Goodyear Extra Power Belting this is. Belts bought to fill every transmission requirement. Working under varied conditions. All required to deliver satisfaction. Think of the great power-saving because Extra Power Belting is flexible. It grips the pulleys and combats slipping. Greater production has almost invariably followed the use of Goodyear Extra Power.

Over a thousand trained engineers and superintendents cannot be misled. You cannot blind over a thousand purchasing agents. There must be—there is—something vital in the Goodyear Extra Power Belting story. Let us send a man trained by Goodyear in belting problems to talk it over with you. He will tell you about Extra Power as it applies to your plant. Should Extra Power not be suited to your needs, we would rather have your friendship than your order. Phone or write the nearest branch.

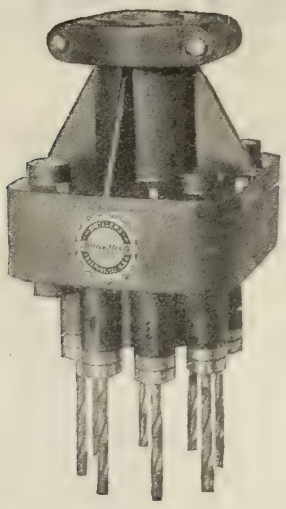
2 Minutes or 20?



This Is The Vital Question

Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

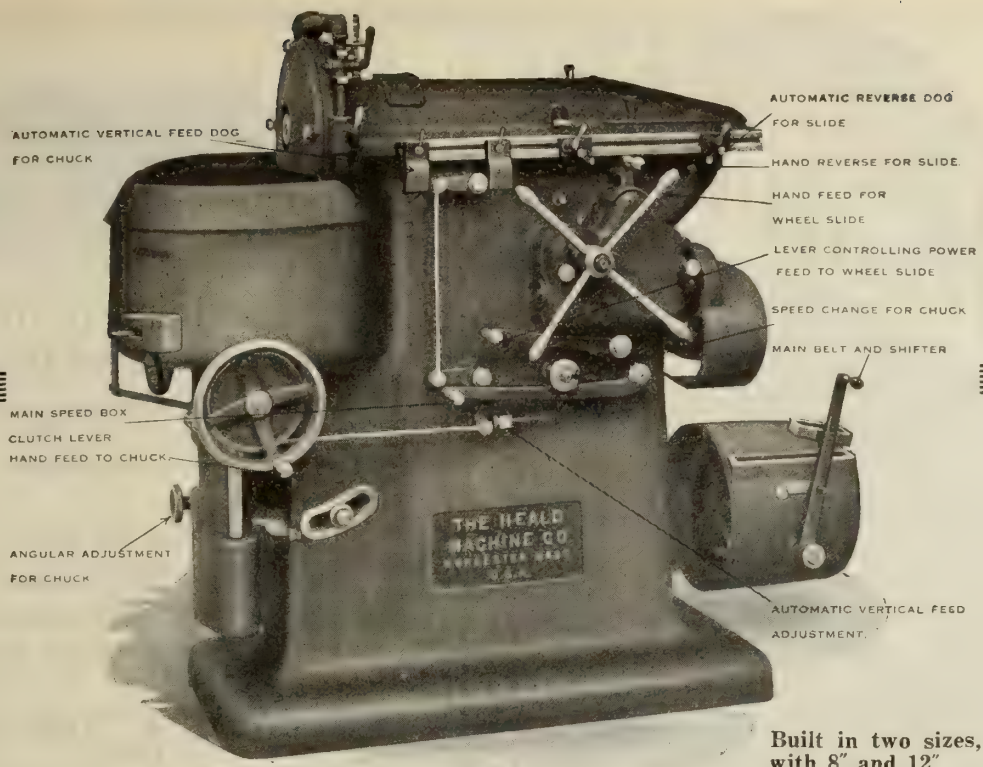
HEALD

AND BE SURE



FRONT VIEW

GRIND WITH A

HEALD

AND BE SURE

Built in two sizes, with 8″ and 12″ magnetic chucks

THE LAST WORD ON ROTARY SURFACE GRINDERS

The new HEALD No. 20 and No. 22 machine is a simple, productive and accurate rotary surface grinder. That the new machines meet the first requirements can be seen from the photograph above. In regard to production and finish, experiments have proven these new machines have no equal in the field to-day.

The WHEEL SIDE is a massive casting having a flat and "V" way insuring continued alignment. Bearing surfaces are large and well protected. Spindle belt operates with a downward pull; an important factor in rigidity.

The chrome nickel WHEEL SPINDLE is mounted in large bearings, all adjustments of which are made at grinding wheel end through an opening in top of slide.

The MAIN DRIVE UNIT receives power from the main line by tight and loose pulleys, transmitting it directly by belt to main speed box, wheel spindle and pump.

MAIN SPEED BOX, situated on the rear of machine, furnishes power to wheel slide by a 3-step cone, and operates the chuck, which has three speeds, through a bank of gears. Wheel slide and chuck are independent of each other, permitting a large latitude in speeds and feeds.

Chuck spindle is driven by spiral gears, one of which is mounted directly on the spindle. Spindle itself is mounted in a sleeve which has vertical adjustment. Upper portion rests in a taper bearing, lower end being equipped with ball bearings—wear is automatically taken up. All control levers and adjustments are within easy reach of operator.

Complete water apparatus is furnished with each machine; built in two sizes, 8 in. and 12 in., with Heald Magnetic Chucks are regular equipment. Motor drive if desired.

Philadelphia, Pa. 2156-D

To cut down the cost per cut

How Many S. P. M.?

"Haste makes waste" is just as true of hack saws as of anything else. Forcing a blade by increasing the strokes per minute means a quickly dulled blade. 50 to 60 strokes per minute is about as fast as it is economical to run when cutting dry. On soft steel, using compound, saws may be run to advantage at about 100 S. P. M., at from 65 to 80 on annealed steel, and on unannealed tool steel at about 60 to 80 strokes per minute.

Follow the Starrett Hack Saw Chart, put on the weight and watch the cutting cost decrease.

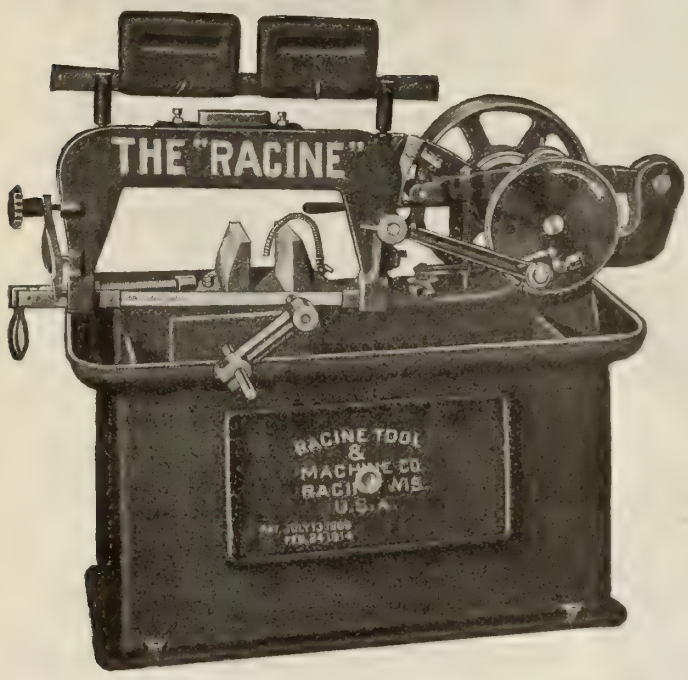
"THE RACINE"



HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

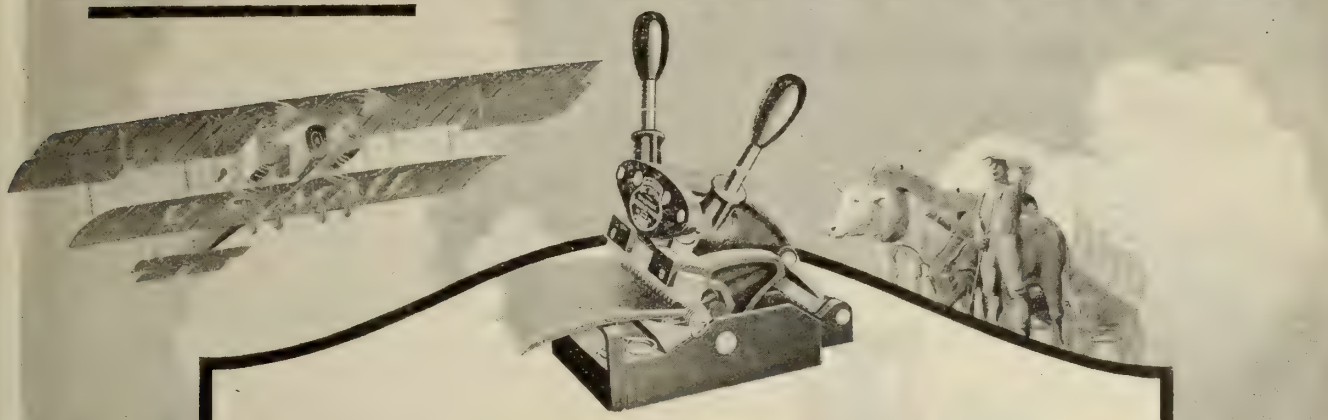
TIME-*the* All Essential



STEAM, electricity and motors—even aeroplanes—have given the world wings to save time since ox-team days—a revolutionizing leap within a few years. The Clipper Belt Lacer has achieved an equally huge saving of time to industry.

Before "Clipper" Lacing came, the breaking of a factory belt caused a serious halt of manufacturing energy—and with it an incalculable loss of workmen's time. It used to take from ten minutes to half an hour to make even an inferior joint. To-day

The Clipper Belt Lacer
Laces a Belt in Three Minutes

It makes a durable joint that is perfectly smooth and flush with the belt on both sides--one that pulls better and is absolutely dependable. The "Clipper" is so simple that any workman can use it—and so important that nearly a hundred thousand of the world's industrial plants have adopted it.

The "Clipper" goes to manufacturers on free trial. It is backed by a perpetual guarantee.

Most mill supply dealers sell the Clipper.
European trade supplied through London Office.
Distributors in all parts of the World.

EXCLUSIVE SALES REPRESENTATIVES:

Canadian Fairbanks-Morse Co., Ltd., Montreal and Toronto; R. E. Ellis Engineering Co., 621 Washington Blvd., Chicago; Fairbanks-Morse & Co., Inc., 30 Church St., New York City; Sherritt & Stoer Co., Inc., Finance Bldg., Philadelphia, Pa.

Double Production

Another Competitive Record for DAVIDSONIZED High Speed Steel Tools

Here are the facts which speak for themselves. The name of the plant in which the record was made, will be furnished on request:

Four straddle mills on arbor, size 6 inches by ½ inch.
Material: High Manganese steel forgings.
Operation: On one machine using cutters of a standard make (not Davidsonized),

2 minutes, 40 seconds

On adjoining machine, using Davidsonized Cutters of same size and type, on the same operation.

1 minute, 5 seconds

A clear case of **more than 100% increase** in production speed through the use of Davidsonized High Speed Steel Cutters.

Furthermore, the Davidsonized Cutters, even at the increased speed, stood up to the work as many hours as the others. Thus, the increase in number of pieces per grinding was also in excess of 100%.

Tool costs, labor costs and overhead per piece produced, all come down in the same proportion.

Through record after record of this unquestionable sort, Davidsonized Tools are being adopted by more and more of the country's foremost plants. Can **you** afford to wait longer before trying them out?

THERE IS "A REASON WHY"

When Germany signed the Armistice, Walcott Lathe Company accepted cancellations of orders for Lathes amounting to hundreds of thousands of dollars. Not one cent of damage from the United States Government or anyone else was claimed on account of the cancellation.

YOU SAY, WHY

Because Walcott Lathes are standard equipment throughout. They are built and designed for manufacturing purposes in sizes to meet every requirement of your shop. Thus, we have had a constant increasing demand for Walcott Lathes for the past thirty-eight years, not from one section of the country, but from all over the world. Our business is good, and our plant is running full time, not a man idle.

If you are interested in new Lathes, specify the WALCOTT, and you will find by their many advantages "The Reason Why."

Notes On Grinding

NORTON COMPANY, WORCESTER, MASS.

No. 67A

Ten Suggestions on Saw Sharpening

1. The success of saw and knife grinding lies in the selection of the right grinding wheel.
2. Soft bonded wheels cut quicker and glaze less than hard wheels. They do not last as long as hard wheels, but produce more work in a given time and are a better investment than hard wheels as they will not case-harden or burn.
3. The proper wheel for the work holds its shape without frequent dressing and cuts freely without tendency to glaze or fill.
4. Keep the face of the grinding wheel true.
5. The grinding wheel of the correct grain and grade running at 5,000 surface feet per minute is the right wheel to use. If a wheel glazes and is found to be running more than 5,000 surface feet, reduce the speed accordingly. If a wheel wears out rapidly and is found to run less than 5,000 feet, increase the speed accordingly.
6. Increasing the speed of a grinding wheel gives the effect of a harder wheel. Decreasing the speed gives the effect of a softer wheel.
   Every saw filer should have a speed indicator.
7. Dressing is not truing but sharpening the wheel. Excessive dressing wears faster than grinding. When too much dressing is necessary it is an indication that the wheel may be too hard, or is running at the wrong speed.
8. The pressure of the grinding wheel should be light on the work. Overpressure does not produce rapid cutting but is liable to cause glazing of the wheel and burning of the teeth. Better and faster results are obtained by light pressure.
9. A wheel that is too fine works with about the same results as a wheel that is too hard.
10. Be sure your machine is free from vibration before you condemn the wheel.

A Rugged Pulley-Gripper

There is nothing like leather for belting, and SparOak Leather Belting has peculiar advantages all its own.

SparOak is a two-in-one belt combining rugged strength with unique pulley-grip. Its great endurance and minimized slip make it a double-service belt of unusual qualities.

Two kinds of leather enter into a SparOak Belt. The outer ply is oak tanned, cut from the best selected center stock. The ply next the pulley is Graton & Knight Spartan leather, tanned to give pliability and traction power unequalled by any other material.

SparOak Belting

Here is an 18" SparOak Belt on a hard drive in a warm, moist atmosphere where the extreme flexibility of Spartan and the firmness of Oak leather are necessary.

SparOak is the answer to a great many perplexing belt problems, saving power and standing up under the most severe conditions.

If you have a troublesome belt drive, consult us as to what belt is required. Maybe it is SparOak, but in any event one of the Graton & Knight Standardized Series of Belts will fit exactly. Write for our booklet on Standardized Belting.

SparkOak Belts grip from the start. During the weeks most new belts take to "work in," a SparOak Belt is giving full power and keeping production up to normal. And SparOak Belts keep on gripping for years under adverse conditions. They withstand repeated shifting, and the wear against step cone or flange pulleys. They render efficient service on drives with high speeds, small pulleys, and heavy loads. In short, any of the factors that quickly wear out ordinary belts affect SparOak belting amazingly little.

Vol. XXI. No. 13. October 2, 1919

Making the "Hall" Line of Pipe Machinery

Four Brothers With One Aim, Namely, to Turn Out the Best Line of Pipe Machinery Possible.

By J. H. MOORE, Associate Editor
Canadian Machinery

A Brantford Industry Which Has Shown Remarkable Growth and Progress in Recent Years.

TO get properly enthusiastic over anything, you must first get cause for that feeling of enthusiasm. Nothing creates such a feeling quicker than a like enthusiasm on the part of the person, or persons, describing some particular operation or system of manufacture, which brings the writer up to the point where he will describe his visit to the plant of John H. Hall and Sons, Limited, Brantford, Ontario.

The moment he entered the plant he was struck with the earnest spirit of enthusiasm pervading the atmosphere. Here was a plant manufacturing a product which it not only thoroughly believed in, but was willing to guarantee to the limit. "When we send goods out of the shop, we do not by any means consider that the end of it," commented Mr. L. S. Hall, "but rather the starting point of our interest, for we have been, and are even more so than ever, following out the policy to check up closely the career, as it were, of our machines. We watch and inquire carefully into how they please, and stand up to their work, and I am glad to say," he concluded, "that the results are very gratifying."

Before going into the methods of this firm any further, it might not be amiss to give readers a short history of this concern, how it started, and its war-time record.

How It Started

The start was made as far back as seventeen years ago, in the same place, namely, Brantford, Ontario. At that time, J. H. Hall, the founder of the concern, was president and general manager, and together with his four sons, L. S., E. W., E. L. and A. R. Hall, respectively, he launched out as a manufacturer of special machinery. Screw cutting machines for the John Morrow Co., were amongst their first orders, and also special pipe machines for the Page Hersey Co; pipe benders, straighteners, etc., were also manufactured during this period. The idea, however, kept to the fore was the developing of their line of pipe machinery, improving this in every way possible, in order to keep not only abreast of the times, but ahead of them.

When war broke out, there commenced an enormous demand for cutting off machines. This firm stepped into the breach, and made certain changes to their pipe machines which turned them into at least a good temporary cut-off machine. But the demand for a special machine grew so insistent that work was commenced on designing one. A point worthy of note, is the fact that they do their own designing; Mr. L. S. Hall being the brother with the designing qualifications.

He promptly got to work with the result that a special rugged machine, equipped with ball thrusts, friction clutch and air chuck, was soon on the market, and in great demand. During last year over a quarter of a million dollars' worth of business was handled by this concern. From the start of war 1,400 machines were sent out, and in many cases exported, one case in point being the sending of a 12 in. machine expressed to Moscow in Russia, during the submarine scare. This is about the only case where the Hall Brothers admit, they haven't followed up the career of their machine. A notable feature showing speed which was exhibited, is as follows: that three weeks after the placing of the first order, the first machine was shipped.

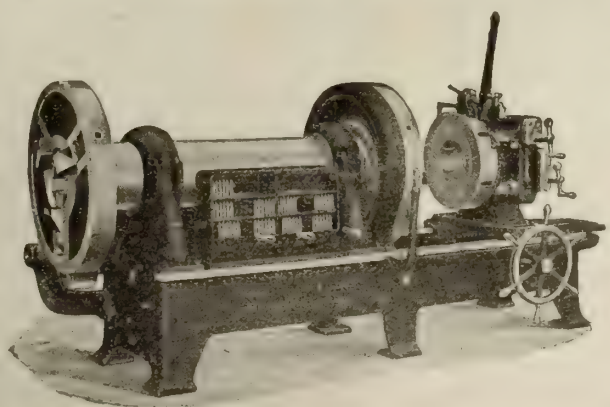

FIG. 1—THE MACHINE AS IT IS NOW BUILT.

But to continue a little more on the personnel of the firm. The father, John H. Hall, who established the business in 1902, lived to see the concern grow to splendid proportions, but passed away suddenly in Los Angeles, a short tim ago, at the age of 67, leaving the business in the hands of his sons, who had so splendidly helped the good work along. It might be well to add that three of these sons are all practical mechanics,

the other being the business spoke in the wheel. Speaking of wheel, gives us an excellent opportunity to show this firm's novel trade-mark, which was designed by L. S. Hall himself.

In each of the spokes is placed a photograph of the brothers, together with the founder of the business. The novelty of this trade mark alone defies its being copied. At the death of J. H. Hall, a shake-up was made in the positions, and following is present duty of individuals mentioned: Mr. L. S. Hall, president and general manager; Mr. E. W. Hall, secretary and treasurer; Mr. E. L. Hall, director; Mr. A. R. Hall, vice-president; Mr. E. L. Williams, office manager and director.

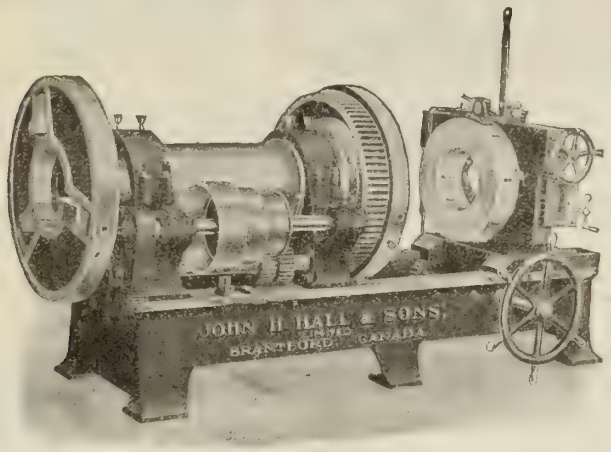

FIG. 2—THE MACHINE AS IT USED TO BE BUILT. (NOTE THE DIFFERENCE AND READ THE TEXT.)

The Actual Manufacture

So now since having placed before readers the inside history, as it were, let us proceed to consider the actual manufacture of their line of pipe machinery.

Pipe lathes, rapid nipple machines, rapid upright roller pipe cutters and special machinery for the tube mills about cover their regular line, but we will chiefly interest ourselves in their pipe threading lathes. Those machines are made in various sizes, from the hand machines up to the enormous capacity of 18-inch pipe. Two of these huge machines are at present under construction.

Their smallest power machine has a capacity up to 2 inch, while they next range as follows: No. 4 Simplex, No. 4 Standard Improved, No. 6 Standard Improved, No. 6 Duplex Improved, No. 8 ditto, Nos. 10 and 12, ditto. Then, of course, comes any larger size desired, such as 16-inch, 18-inch, etc. To go over all their lines in detail would be impossible, but one thing that impressed the writer was the compactness, yet absolute rigidity of these machines. All gear changing levers are within easy reach of the operator, and driving pulley is entirely out of his way.

Perhaps the best way to point out what the writer refers to, would be to compare Figs. 1 and 2. At Fig. 1 we see the machine as this firm used to build it. Note: the driving pulley and gears all exposed, and very much in the way. But now, refer to Fig. 2 and see the difference.

A Comparison

Where before, the cone pulley and gears stood in the way, we find these placed entirely out of the way. In their place is a convenient cabinet for storing the dies used on the machine. The advantage of such a cabinet is self-apparent. There is also a small pocket cast on the side of this cabinet to hold orders, etc., that the operator might need to refer to. In other words the operator is considered at all times in the design.

The gears are also totally enclosed, and run in oil, which is a great improvement over the former method.

The lever operating these gear changes come out as shown on photo, within easy reach of the operator, and all the different changes obtainable are plainly marked, in order that the operator cannot get confused. A single drive pulley is placed at the back of the machine, on a special drive shaft. A friction clutch is also installed in connection with this pulley. Such a scheme allows the operator to turn the spindle head around a very short distance when desired. A feature such as this needs no coment to impress readers with its benefits, for the lack of this feature has been a serious drawback so far.

There is also a rotary gear pump on the rear of machine. This pump is re-

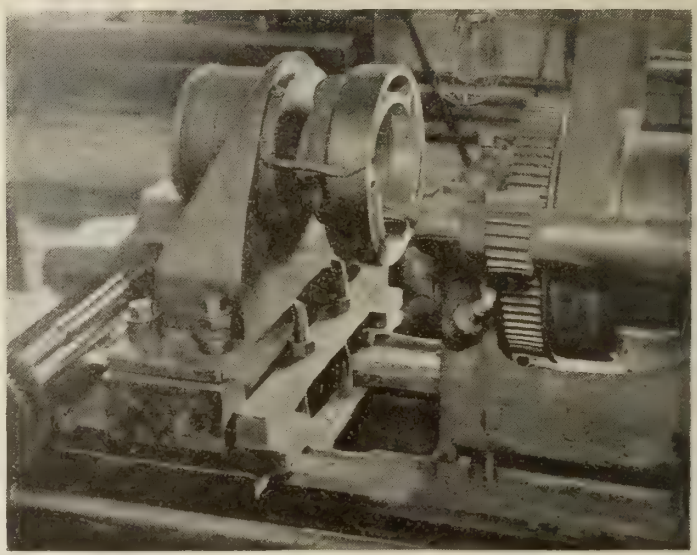

FIG. 4—MILLING THE CAMS ON THE DIE HEADS.

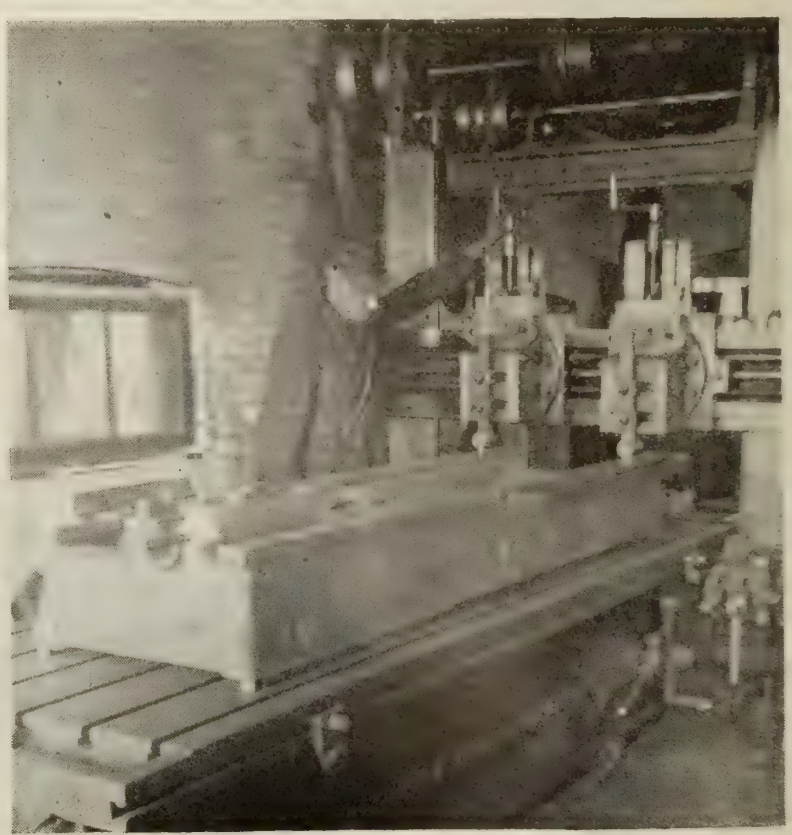

FIG. 3.—PLANING THE BED OF A DUPLEX PIPE LATHE.

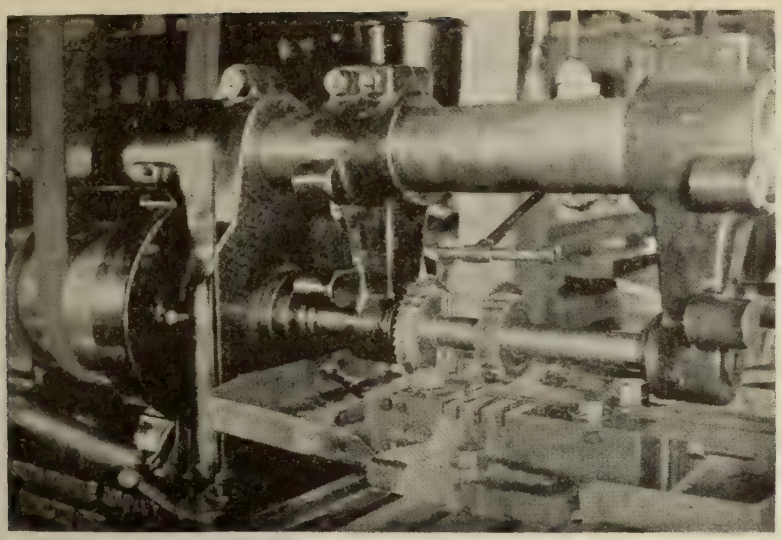

FIG. 5—MILLING THE DIE BLANKS WITH A FORD-SMITH MILLER.

versible, so, of course, it does not matter whether you are cutting right, or left hand threads, the pump will work equally well.

All spindles are self oiling, and the main spindle bearings are oiled from a chain which runs at all times in a well of oil. This feature is obtained through the design of the bearing and caps, which have a hollow core to accommodate the oil and chain. Interchangeable bronze nuts are furnished in all jaws of machine.

Micrometer adjustment is arranged for in the die head, also a special arrangement for centering the pipe. There is also a cut-off tool, and reaming tool, in connection with the die head on the large size machines.

To enumerate all the points of design would occupy too much time and space, suffice it to say that each point throughout these machines has been carefully thought out, and designed with the idea in mind to make them as far as possible in a class by themselves.

Of course, as the reader will understand, these machines can be fitted up with motor drive, in fact, in many cases, this is done and the machine is designed with this idea in mind. To place a motor on these machines is not a case of afterthought, for there is a pad, and special bracket, so arranged that when desired this method is installed.

It might be well at this point to show by illustration some of the operations on these machines.

Planing the Bed

At Fig. 3 we see a bed for one of their duplex pipe lathes being planed. There are a few points to which the writer would call your attention. Note how the bearings for the gear box are all self-contained in this bed. Directly below these bearings there is a trough, which holds the oil in which the gears run. Another feature is the trough shown on the side of the bed. This trough or tray catches all the oil drips, which would have a tendency to run down the side of bed, giving it a sloppy appearance. By means of this tray the machine is always kept looking neat and clean. One other point in connection with this bed, is the fact that all points slope toward the centre, that is, such points where oil would strike. In this way the oil all runs to the centre of machine, and later passes through two drain holes, with strainer attached. In this way the same oil can be used over and over again, yet is always clean and free from cuttings.

The other points of interest in this photograph can easily be ascertained by a study of the photo.

Milling the Cams on Head

Another of interest is shown at view at Fig. 4. Here is a novel fixture designed to mill, on the lathe, the die

FIG. 6—HOBBING A SET OF DIES ON SPECIAL FITTED LATHE.

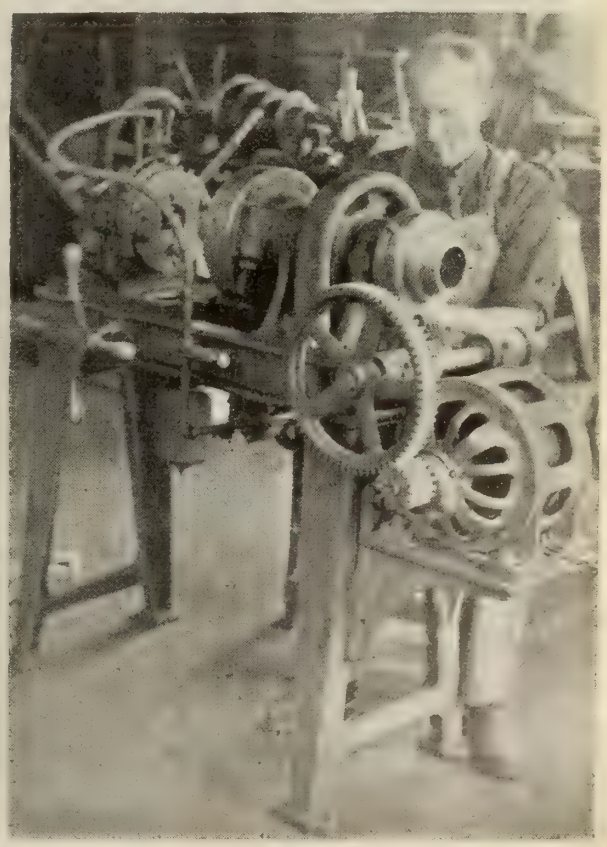

FIG. 7—ASSEMBLING A SMALL MOTOR-DRIVEN MACHINE.

heads, which have three, four or six peculiar shaped cams, as the case may be, on their face. The one illustrated has three such cam shapes. This lathe has been specially rigged up to take all sizes of these heads, and is fitted with worm drive at back, connected to the saddle. Of course, this feeds the saddle crosswise at a certain speed, depending on the cutter, and cam being machined. Different plates are placed on master cams, to suit conditions. High speed cutters are used and one operator runs three machines. Readers can, by studying this picture, follow further its various details.

In Fig. 5 we see a Ford-Smith miller busy at work on die blanks for these machines. Four cutters are used, two slitting and two lipping cutters; of course, the two lipping cutters mill the lip on the die blank, while the slitting cutter cuts them off.

Hobbing the Dies

Fig. 6 shows the operator at work on the hobbing out of a set of dies. This operation is a very important one, and is performed in a very creditable manner.

The die blanks are placed in a specially constructed jig as shown, and a special saddle has been constructed to hold the milling cutter, which is made of first-class high speed steel.

The driving mechanism for the head is also special, being a worm drive to reduce the head speed to suit. These dies are now cut with special care, for after all is said and done, the dies are the main portion of the machine. Pure lard oil is used, and the dies are hobbed at a very slow speed to ensure absolute accuracy. Approximately 6 hours is occupied in the cutting of a set of dies.

Readers will notice that this machine is also a lathe converted for this special purpose.

The hardening of the dies is also an interesting study. A special chart has been made, based on what has been found best for each particular purpose, and this is strictly adhered to. Pyrometer, etc., etc., form a part of this hardening department.

At Fig. 7 we see a smaller machine with motor drive attachment being assembled. Readers can readily grasp the compactness and general appearance of this machine from the photograph.

Throughout this article the writer has endeavored to emphasize the fact that the work on these machines is carried out with extreme care, and before going on to the next portion of this article it will be well to lay stress upon the fact that no work is passed through the shop except perfect in every detail.

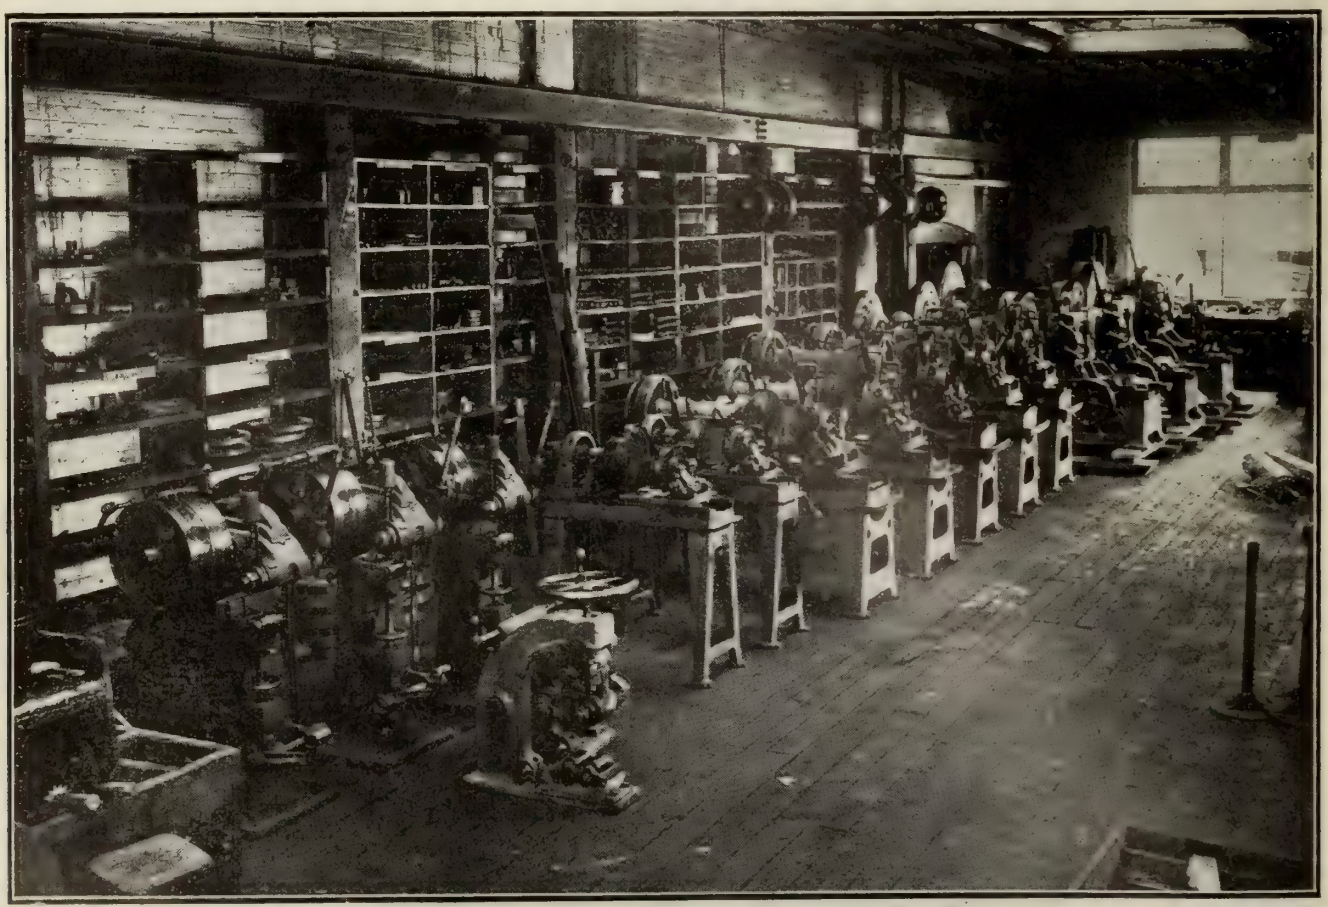
And now a word as to the service schemes instituted by this firm.

As stated before, they do not consider their obligations ended by the sale of a machine, but they follow up its subsequent performance. They know that the die problem is a large one, in fact, that it is the main problem, and so to cope with this as far as possible they have issued a bulletin entitled: "How do your dies die"? In this pamphlet, with such a novel heading, they go on to describe first—questions you should ask yourself—for instance: "What production am I getting from my dies?" etc., etc. All these questions are real practical ones, met with every day. They then show photographs of dies improperly ground and show why you cannot get results from such dies. They last of all tell you how to secure the maximum production and make up a chart, strictly for the man on the machine to work from.

They also issue a chart, showing every part of their machine, so that anyone can easily get familiar with all parts. Numerous other service bulletins are on the way, and as Mr. L. S. Hall told the writer, "our aim is to make our service practical and worth while."

Perhaps the best method of concluding an article of this nature would be to quote a little statement, made by L. S. Hall himself, which he mentioned in an offhand way to the writer. "I have always had a pet hobby," he said, "to feel that whatever I designed was a stop above any former effort, and I also felt that a business, to succeed, must not only give the customer all that he expects, but a little more.

It is this policy that is making them feel cramped in their present quarters in spite of the addition made to their plant during wartime, and it's a safe bet that there will soon be another addition added if the present policy of this company continues, as it will, of course, so long as the present executives hold office.



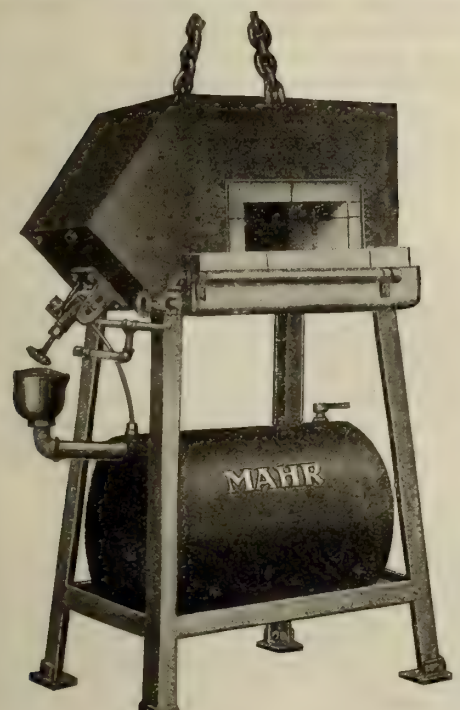
A GENERAL VIEW OF MACHINES HELD IN THE SHOP FOR EXHIBITION AT THE RECENT C. A. S. E. CONVENTION AT BRANTFORD.

Description of a Mahr Calorizor and Furnace

Oil Burning Furnaces For Forging and Heat Treating Purposes Are Rapidly Becoming the Usual Installation in the Industrial Plant of To-day. This Describes One Such Furnace

By J. H. RODGERS, Associate Editor Canadian Machinery

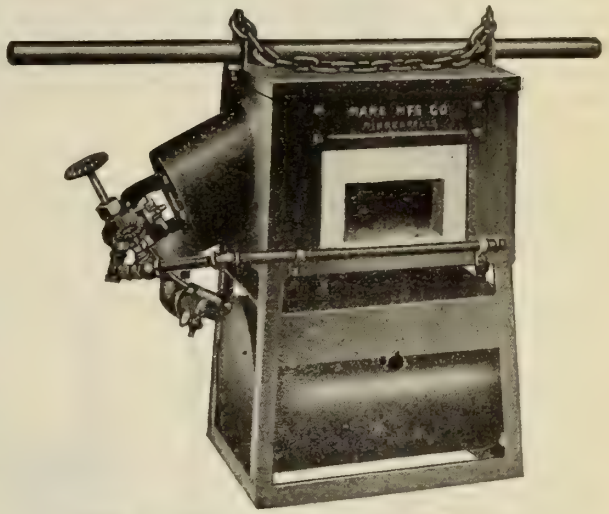
THE oil-burning furnace, for forging and heat treating purposes, is rapidly becoming a very essential feature of present industrial enterprise. The necessity of scientific application of heat in the treatment of shell forgings, to conform to definite specifications relative to the manufacture of munitions, has demonstrated the advantages that could be derived from a better knowledge of this branch of engineering practice. The acceleration of efficiency in the construction of furnaces during the war, was amply illustrated in the improved designs that were in successful operation at the close of active shell production. Experience, coupled with the study that has since been given to this all important unit, the oil-fired furnace, has enabled engineers to make further progress along these lines, and faulty design is gradually being eliminated and being replaced by improvements that will eventually establish the extreme economic value of this particular type of furnace.



GENERAL VIEW OF THE MAHR FURNACE.

In many styles of furnaces the actual heating chamber, in which the parts are subjected to the heat treatment, is likewise utilized as the combustion chamber, and the inevitable presence of oxygen necessary for combustion, invariably results in oxidizing the metal in the furnace. This has always been a serious factor in the process of heat treatment of steel or other metals, and unless extreme care is exercised, the resultant effect of oxidization is frequently costly and inconvenient.

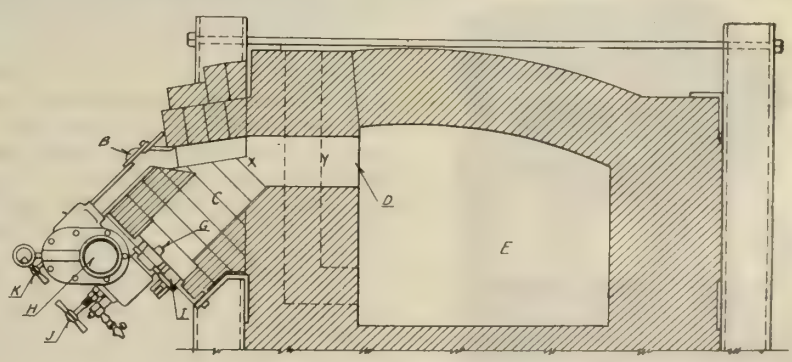
Realizing that a high efficiency furnace must be one in which the oxygen in the fuel mixture would be entirely consumed before coming in contact with the work in the furnace, the Mahr Manufacturing Co. of Minneapolis, Minn., have perfected a design of furnace in which the above requirements have been met. Apart from the method of carrying off the waste gases, the general design of the furnace proper differs little from those of other makes, but it is the design and construction of the burner and the combustion chamber that gives to the furnace its individuality and economic value.



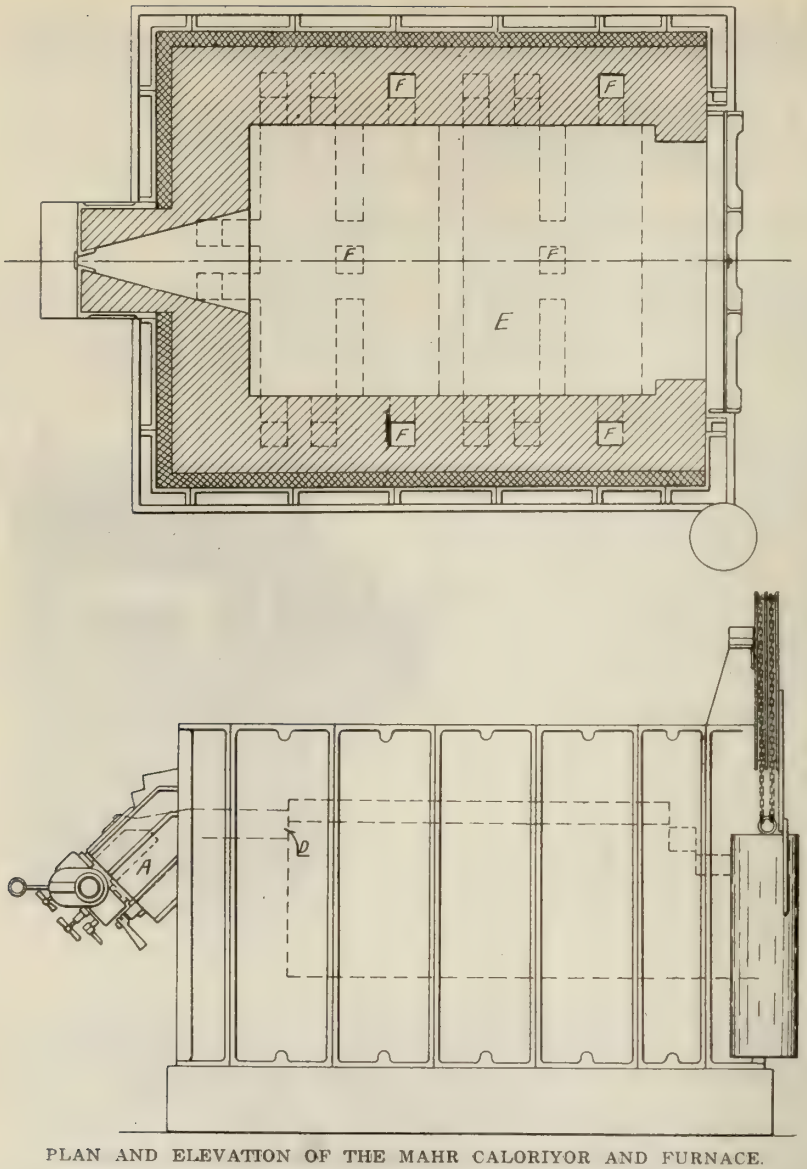
A TYPE OF FURNACE OF LOWER CONSTRUCTION.

It will be seen from the illustrations that the calorizor A is attached to the outside wall of the furnace in such a position that the opening D into the furnace is located near the roof of the heating chamber E. This permits of a swirling movement of the gases as they distribute to all sections of the heating chamber. Even after the gases have done their initial work, the surplus heat is still further utilized by a special arrangement of the outlet flues F, F, etc., as these circle the fire chamber, through the brickwork, before passing to the atmosphere—a decided improvement over the old method, where the waste gases passed directly through the roof.

A brief description of the action of the calorizor may be given as follows: The oil enters the combustion chamber through the oil nozzle G, and is atomized by the main air supply entering at H and passing into the combustion chamber around the oil nozzle. The atomized oil, having been lighted through the lighting hole I, receives a further supply of air through the lower air valve J. The effect of the due adjustment of these valves is to carry the flaming gas up to the point X, where it is met with an additional supply of air entering through the upper air valve K, this second current of air completing the combustion at the point approximately marked Y, at the same time giving the hot gases, so produced, the necessary velocity to carry them across, and circulate through the heat chamber. In the lower duct, between the oil nozzle G and the point X, the atomization and the combustion should be carried well forward, but the supply of air should not be so great as to draw the flame entirely away from the lighting hole pocket. The peep hole is shown at

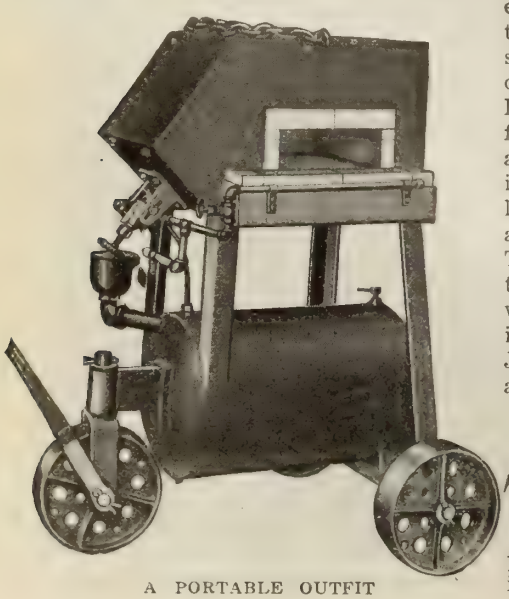


SECTIONAL VIEW THROUGH THE FURNACE.



PLAN AND ELEVATION OF THE MAHR CALORIYOR AND FURNACE.

B. If the above directions are closely adhered to it is claimed that but a short tongue of flame, at most, will find its way into the heating chamber, and the gases therein will be so free of oxygen that no oxidization of the metal will take place. The even distribution of the heat is aided by the fan-shaped calorizor duct, where it enters the furnace. The action of the calorizor is similar to that of the carburetor on an automobile, where the latter is fitted with independent air valves. For satisfactory operation of these calorizors it is only necessary to have an air pressure of about 8 ounces, supplied by means of a blower. In general, the Maar calorizors are uniform in size, but in the smaller furnaces and portable forges the calorizor is built into the furnace frame, while for the large furnaces the calorizor is a separate unit and can be located as desired. These furnaces are made in various types and sizes, including rivet, flue welding, forging, annealing and hardening types of every description. The James Buckley Company, of Montreal, are the exclusive Canadian agents.



A PORTABLE OUTFIT

AN IMPORTANT AFFILIATION

THE National Safety Council announces an affiliation with the University of Cincinnati for the purpose of carrying out a program that is unique—almost radical—both to the fields of education and accident prevention, and that opens a new and promising avenue for the service of the council.

Briefly, this program includes the establishment of an industrial medicine division at the University of Cincinnati, where medical students and graduate physicians will be given special training not only in industrial medicine, but in industrial relations, including sanitation and all the fundamentals of safety work as well. This school, which is already under way, is unusual in many respects, chief among which are the following:

1. The student physicians alternately spend part of their time in school and and part in the field among the industries of Cincinnati, Dayton and other Ohio cities, receiving actual experience in the work for which they are being prepared;

2. The enterprise was conceived by, and is being financed by the industrial leaders of Cincinnati and the vicinity, who have guaranteed a fund of about $40,000 annually for five years;

3. In addition to the regular courses special courses will be given in such subjects as: (a) the medical, industrial and safety problems arising from the coming of women industry; (b) public health, and (c) hospital management;

4. The facilities of the school include an industrial research laboratory where physical conditions menacing the health of employees arising in industry will be brought up for investigation and solution. How can dust be eliminated in a certain plant? Is this gas injurious? How can the lighting problems of a peculiarly arranged factory be solved? These and all similar problems arising among the industries represented among

DETAILS OF REFRACTORY CONSTRUCTION.

Nichrome Castings for Heat Treatment

The Subject of Proper Material For Heat Treating Receptacles is a Vital One and Herein Are Described Points of Merit in the Properties of Nichrome For Such Use

By HARRISON JENKINS

IN heat treating processes such as annealing, carbonizing, hardening and tempering, there is a demand for containers or receptacles made of metals or alloys which will maintain their strength and durability at high temperatures. Such receptacles undergo repeated cooling and heating from 1,500° F. to 1,850° F. and in order to avoid costly maintenance due to additional expense for labor, fuel, material and constant replacement, the heat treating containers must not be subject to cracking, changing in form, forming a surface scale or warping. Where the walls of annealing boxes, carbonizing boxes, etc., increase in thickness due to growing, or form a hard surface scale, relatively more time is required for the completion of the heat-treating process. In this case it takes longer for the heat to penetrate into the work. Where the physical strength of the material is comparatively small, it is necessary to increase the dimensions and weight of the receptacle to such an extent as to make handling difficult and to require considerable labor. The walls of heat treating containers are preferably to be made thin as possible in order to facilitate the greatest heat penetration.

Strength of Materials at Low and High Temperatures

Although many metals and alloys have almost any required physical properties at ordinary temperatures, still all undergo a reduction in strength, change of form or scaling of the exposed surface at high temperatures.

There is a destructive reduction in the physical strength of cast iron, cast steel, structural steel, and wrought iron, and other ferrous materials when subjected to relatively high temperatures. Athough in one set of experiments, structural steel at 400° F. showed an increase of 32 per cent. of it normal strength of 70° F. and similarly wrought iron at 570° F. had a 16 per cent. greater strength than its normal strength at 70° F., nevertheless both of these materials had a tensile strength at 1,500° F. less than 18 per cent. of their normal strength at 70° F. At 1,100° F. cast iron had lost 42 per cent. of its normal strength at 70° F. and copper and bronze showed reduction in strength at as low a temperature as 200° F. The figures given would be, in general, subject to variation because of differences in the composition of materials of this class. Nevertheless, they are examples of the destructive effects mentioned above.

When cast iron is repeatedly heated to 1,700° F. it undergoes a change in size, which is generally known as "growth," always accompanied by an increase in weight, equivalent to approximately 7 or 8 per cent., which is due to the absorption of gases in the formation of oxide.

At high temperatures the oxidation of the heated metal causes a scale to be formed on the surface of cast steel and wrought iron containers, which usually reduces the size of the pot upon repeated heating, as in the case of annealing and case-hardening processes where the original scale cracks off, thereby exposing a fresh surface, which again scales.

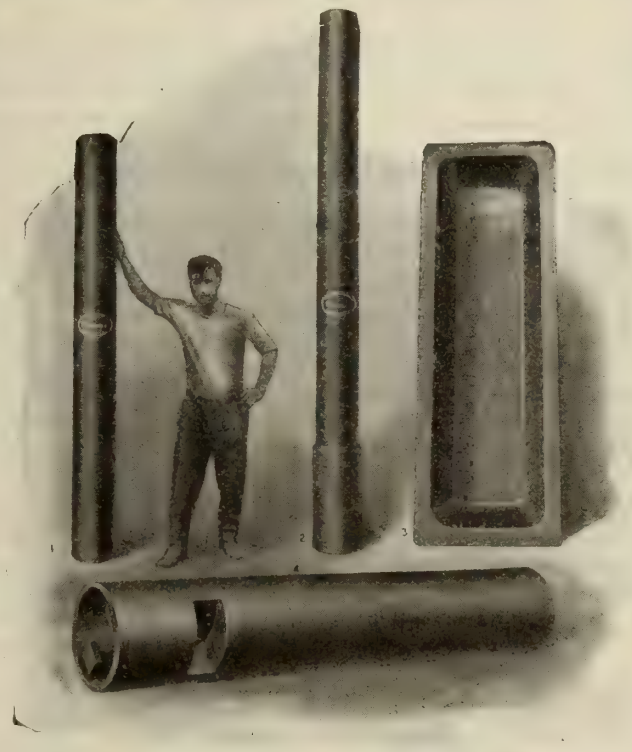

FIG. 1—TUBES OF CAST NICHROME.

Properties of Nichrome

The injurious effects referred to are claimed to be avoided in many cases by the use of a nickel chromium alloy known as "Nichrome." This alloy made by the Driver-Harris Company, Harrison, N.J., is composed of about 60 per cent. nickel, and the remainder principally chromium. It is melted in an electric furnace, and is cast in various shapes and in any weight up to 5,000 lbs. Nichrome is already well-known since it has been used for some time in the manufacture of resistance coils and elements, for electrical heating apparatus and rheostats. The surface of nichrome boxes and containers does not oxidize at high temperatures, except in oxidizing atmospheres when a thin film of the oxide is formed, which is extremely strong and durable. This oxide film resists the action of alkalies and of such acids as sulphuric and hydrochloric. It is non-flaking and affords additional protection against corrosion or further oxidation.

Unlike iron or steel, nichrome is said to show no growth or appreciable change of form, as a result of alternate heating and cooling.

It will bend considerably before breaking, even when red or white hot. This quality may be demonstrated by heating to a red heat a plate of nichrome ¾ in. thick, and then striking it with a 20 lb. sledge upon the unsupported centre of the plate. The result is a very gradual bending.

The tensile strength of cast nichrome at 1,500° F. is approximately 24,500 lb. per sq. in., or about 30 per cent. greater than the tensile strength of cast iron at 70° F. When cold, nichrome has a tensile strength of about 50,000 to 55,000 lb. per sq. in. It softens at about 2,500° F., and melts at approximately 2,750° F.

For heat treatment, cast nichrome is adapted for annealing and carbonizing boxes, heating retorts of various kinds, cyanide hardening pots, lead tempering pots, etc.

Some of the most useful applications of this alloy will be mentioned to illustrate the possibilities of cast nichrome as a substitute for other materials, in order to avoid cracking, growing, scaling, warping, change of form, corrosion or reduction of strength.

Nichrome castings are used extensively for annealing and carbonizing boxes. (See Fig. 1). They are much more durable than boxes made of cast steel. Whereas a steel box must be made quite thick in order to withstand reduction of thickness caused by scaling or oxidation, nichrome containers can be made thin and correspondingly light. Thus, efficient heat conduction is insured, at the same time maintaining sufficient strength. The durability of ferrous boxes is limited to approximately two hundred and fifty hours' service at

1700° F., whereas cast nichrome boxes under the same conditions quite commonly give seventy-five hundred hours' service, and in some cases as many as eleven thousand hours' service has been obtained. While nichrome castings are more expensive than cast steel or cast iron containers, the difference in cost is more than offset by the superior qualities mentioned, and by the low operating cost per hour, which its use assures.

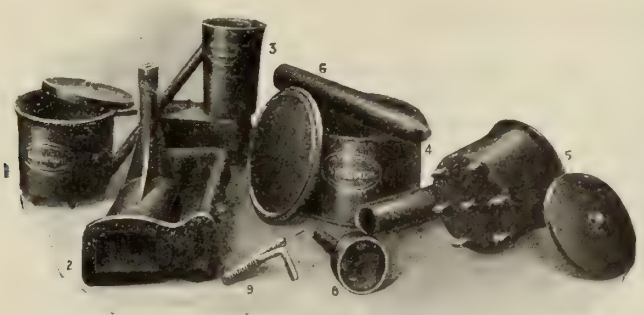

FIG. 2—ROTARY RETORTS.

An important industrial application of cast nichrome is the dipping basket and holder used in immersing small heated iron or steel parts in a carbonizing cyanide bath at 1700° F. Similar baskets or utensils are used for pickling purposes and heat treating work. These nichrome baskets may be used for a considerable period of time without being appreciably affected by the cyanide, nor do they shrink or lose weight They are about one hundred times as durable as iron or steel wire baskets.

Rotary retorts (see Fig. 2) of cast nichrome for gas furnace applications are used in a great number of plants throughout the country with a life at temperatures of 1600° F. to 1800° F. of from eighteen months to two years, as against twenty days to four weeks with ferrous materials.

Tubes of cast nichrome are used in many processes, as in the manufacture of hydrogen and rare gases from the atmosphere, or the treatment of wire in the manufacture of lamps, and also in the ball bearing industry.

Miscellaneous Applications of Cast Nichrome

The fact that cast nichrome withstands high temperatures, has enabled this material to be used for many important industrial purposes, besides containers for heat treating processes.

Cast nichrome is being substituted for other materials for many parts of special glassmaking machinery, for equipment for melting, pouring, conveying and rolling molten glass. The nichrome molds withstand a high temperature and produce more highly polished glassware. As in other applications, the molds are strong while hot, and therefore can be made much lighter than cast iron molds.

The Telautograph and Its Uses

An objection to the telephone is that it makes no record. For purposes where accuracy and a written record are required, the telautograph, which gives electrically, at any distance, an exact facsimile of writing or drawing done at the transmitting station, is being substituted in many commercial and industrial plants. How it now serves a valuable purpose in great steel mills is described by a contributor to the "Iron Age." These mills, we are told, have had to resort to messengers for carrying and distributing messages and analyses. The use of the telautograph does away with this unsatisfactory and dilatory service and reduces cost as well as increases the speed of distribution. We read in the magazine named above:

"Whatever the saving in dollars by eliminating the messengers' salaries, after all is far less than the indirect saving accomplished through the quicker delivery of analyses to the points where the progress of the work is dependent upon them. This is particularly and strikingly true at the open-hearth furnace. Before the telautographs were installed, in one plant, one hour elapsed between the time a sample was taken of the heat of steel from the open-hearth bath and the time the messenger came back from the laboratory with the analysis. All this time the steel was oxidizing and changing its constituency and the work of the plant was halted. With the use of telautographs this period of waiting has been reduced to about one-half hour, and therefore the melter at the open hearth is able to perform his duties more skilfully and more effectively.

Blast-Furnace Department

"In the blast-furnace department the chief gain also is not in money saved through the employment of less labor but through increased efficiency obtained by getting laboratory reports quicker, and thereby enabling the mixers and furnaces to handle their work with precision.

"In the blooming-mill it is impossible to say just how many dollars and cents are saved by the telautograph through the elimination of mixing of heats which results in the shipment of wrong qualities of steel to the various customers. It is not possible to estimate how many mistakes would be made and how costly they would be if the telautographs were not used to keep things straight. Very often ingots have been rolled into billets, cut into required lengths, and loaded on flat cars for shipment when it was discovered that the steel had probably been mixed, making it necessary for a chemist to enter the car and drill a sample of every billet for analysis. Also frequently errors in mixing are not discovered until shipments have been received by a customer, and the plant officials were not aware of the fact until they received the complaint.

"The telautograph is not limited to the sending of words only, but it can transmit numerals, signs, symbols, sketches, or anything else that is written at the transmitting end and accurately reproduce them at the receiving stations. Furthermore, it can send messages to a single point or simultaneously to any number.

Specification Records

"Practically all orders for iron and steel contain specifications describing just the quantities of carbon, silicon, sulphur, phosphorus and manganese that the materials to be delivered on the orders should contain. Each order is given a heat number to identify it throughout the plant, and copies of the order with specifications and heat numbers are sent to the laboratories, blast-furnaces, open-hearth and Bessemer mixers, soaking pits of the blooming-mill, chief recorder of the blooming-mill, hydraulic shears, billet and bar-mill, breaking-down mills and bloom yard office or other place where lies the control of final assignment to orders of heats or blows of steel."

The manufacture of all steel starts with the blast furnaces and the mixers. A sample of each heat from the blast furnace is sent to the laboratory for analysis and the results are written simultaneously to telautograph stations at the blowers and the mixers. This enables the blowers to know just what kind of iron they are making and whether they are approaching the specifications, while by obtaining this information in advance the mixer is able to prepare for handling the ladles when they arrive. This same plan runs through all the other operations in the mill. In addition the telautographs are employed at the billet-mill and at the shears to notify the chief recorder when any breakdown occurs and how long it will take to repair the damage. This enables him to plan a re-distribution of the work. To quote further:

"According to the geographical layout of the mills the need of various special telautograph services develops in different mills. In some they make good use of a telautograph line between the tube-mill and the tube-mill shipping-office for the shipping-office to report the names, numbers, and weights of freight cars they have loaded, together with the net weight of material in the cars.

To Those Interested in the Drafting Course

SO great has been the demand for reprints on our Drafting Course that we felt this demand was worthy of special consideration.

"Are the reprints satisfactory in every way, or would it be good policy to republish this course from Part 1?" we asked various outside responsible parties, and in every case this suggestion met with immediate approval.

As one party remarked, "Why not run Parts 1 to 7 inclusive every week in place of every two weeks? Offer prizes as before. Let new students have an equal chance to earn prizes, but also allow old students to again participate. It will only take seven additional weeks to run these former parts, and you will have given all an equal chance in this very necessary study."

So, following this advice, we republish Part 1 in this issue, and suggest that students, old and new alike, send in their work for judging as early as possible. Part 2 will appear next week.

Three prizes will be given for each part as heretofore, and as the number of students is greatly increased the competition is bound to be keen and full of interest.

The sooner we receive the plates, the quicker we can announce the winners, so again let us say: "Let us have your work promptly."

We shall be pleased to receive the opinion of students in general regarding our policy of republishing the course in this way.

Canadian Machinery Drafting Course, Part I

The Full Page Announcement on Page 345 Fully Explains Why We Republish This Portion of Our Course. We Hope the Interest Shown Will Continue, and Increase as Time Goes On

By J. H. MOORE, Associate Editor Canadian Machinery

BEFORE re-entering upon this series of talks or lessons on the art of mechanical drafting, the readers, both old and new, must realize that we could never, through the medium of a paper of this nature, conduct a rigid and very detailed course, for such would take years to complete, and ten chances to one become tiresome to the average reader.

What we do intend, however, is this, that for the reader who wishes to grasp the art of drawing as quickly as is practical and possible, we will prepare for him such lessons as we believe will help him along. The idea of re-issuing the seven parts which we formerly published is two-fold. First, to accede to the wishes of the many new students, and to be fair, we want to give them an equal chance from the beginning, while secondly, it will, after all, do no harm to those already enrolled to go over the ground once more, and perhaps win a prize where they did not before.

It is only a matter of seven weeks' difference, for in these reissues we will publish a portion every week in place of every second week.

We are especially desirous of having the students send in their work. We, in this way, see how they are progressing and know that a keen interest is being taken in the course. We expect about 250 students to be taking part in these lessons, so keen competition is sure to be the rule. Old students and new alike are eligible for these prizes, so let us see your work as early as possible.

Regarding the course, we will try to only touch on the most essential points as we go along, keeping in mind that this is a course specially arranged to meet the requirements of the machinist apprentice, in order to illustrate to him the basic principles of mechanical drawing and its application to the working drawing.

We will work up gradually from the straight line problem into the actual assembly drawing, but will go to such a stage by easy steps. We want the apprentice to feel that here is a course specially arranged for him, and should he get puzzled at any time that we will be only too willing to answer him, and lift him over the difficulty. Close study of this course should increase the earning power of the student, and besides, the objective of each student should be to land at least one prize. So now that we have introduced the object and aim of this series, let us proceed at the very beginning and see what mechanical drawing really is.

Mechanical Drawing

To put it as briefly as possible, mechanical drawing is the method of showing graphically the intricate details of machinery. It is, so to speak, the language by which the draftsman speaks to the workman. A brief study of a well-executed drawing gives a much better idea of the machine portrayed than a long-winded verbal, or even a detailed written, description would ever do. In fact the better and clearer the drawing is made the easier the workman can comprehend the ideas of the draftsman.

A neat drawing for instance was never made by a careless worker, nor even by a good draftsman with poor instruments, but as you seldom see a good designer with poor instruments one can usually tell the character of the draftsman by his style of drawing.

To the beginner, however, a cheap grade of instruments would suffice, but as he becomes more expert he would do well to secure a better grade of tools. In fact, if one can afford it, the best plan is to purchase the better grade right at the start, but this is simply a matter which rests with the student himself.

Instruments and Materials

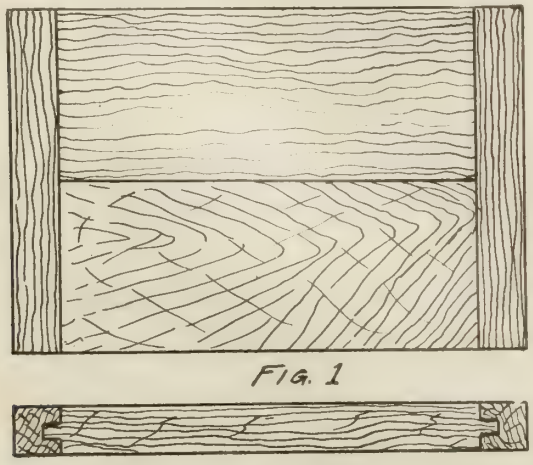
First comes the question of paper. In selecting drawing paper, the first thing to be considered is the kind of paper most suitable for the proposed work. As we are principally interested in the needs of this course, we will consider only the paper most suitable for our purpose, for practically every drawing office throughout the country have their own particular pet paper, which they claim is the best ever.

To keep the expense item down to the lowest possible figure, we will call for sheets 9½ x 13½ in. in size. This allows students to purchase their paper in what is called the demy size of sheet, this being a sheet 15 in. x 20 in. By careful cutting you have two sheets from each large one, 10 in. x 15 in., sufficient size to cover the work. Whatman's paper is considered by many the best grade of paper, and either the cold pressed, or hot pressed, will answer the purpose. The hot pressed paper has a smoother surface, but does not stand erasures as well as the cold pressed sheets, so it might be well for readers to get the tougher material, for no doubt there will be considerable erasure made at the beginning.

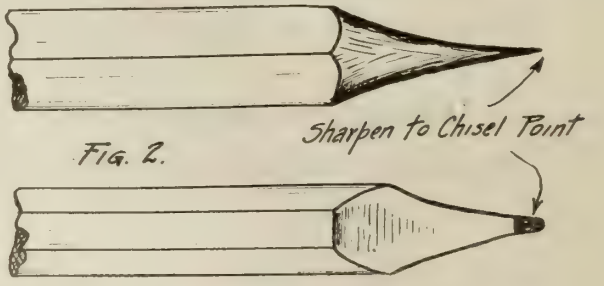
Drawing Board

The drawing board, Fig. 1, is usually made of well-seasoned, and straight grained soft pine. Each end is protected by a side strip, usually about 2 in. wide. This strip is trued accurately to suit the T-square, but as students will more than likely purchase their drawing boards, we will leave this matter for the reader to study at his leisure.

Thumb tacks are used to fasten the paper to the board. There are all kinds on the market, but a grade about 10c to 20c a dozen will suit the student's purpose admirably.



SKETCH OF DRAWING BOARD.



SHARPENING THE PENCIL.

In regard to the pencils required. Lead pencils are graded according to their hardness, the degree of which is indicated by the letter H. For example, H means simply one degree of hardness; 6H, six degrees, and so on. A pencil of 4H grade is ideal for general working conditions. Some authorities claim 2H or 3H are better suited for lettering purposes, while for intricate detail work a 6H pencil will be found best suited to this class of work.

The hard pencils should be sharpened as shown at Fig. 2, so that in penciling a drawing the lines may be made very fine and light. The wood is cut away so that about ¼ in. to ⅜ in. of lead projects. Lead can now be sharpened to a chisel edge as shown on the sketch. In the drawing of the lines the student should place the chisel edge against his T-square, or triangle, enabling him to draw a clean-cut fine line, through points as desired. Should no inking be necessary, a softer grade of pencil is used than if it is intended to ink in over the pencil work.

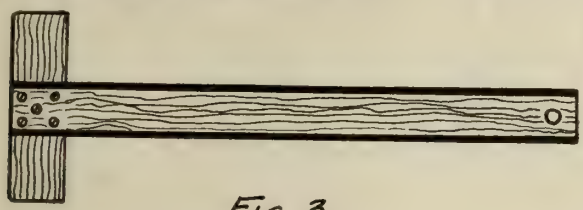


Fig. 3.

SKETCH OF "T" SQUARE.

T-Square

The T-square gets its name from its general appearance, and consists of a thin straight edge called the blade, with a short piece called the head, and fastened at right angles to it, see Fig. 3. T-squares are usually made entirely of wood, pear and maple, in the cheaper grades; mahogany, with protection edges of ebony, in the middle class, while celluloid edges are placed on the more expensive ones. Readers need not go to much expense on this end, except they really wish to, for a T-square of good quality can be secured for very little cost. Some T-squares are also provided with swivel heads, but for the purpose of this series we will not discuss this point, as it is not a necessity.

To show clearly the use of the T-square, refer to Fig. 4. Always keep the head A up against the left-hand edge of the board, otherwise the various lines drawn will not be parallel. Lines A, B, C, D, and E, are drawn ¼ in. apart and 6 in. in length.

Take a piece of paper and practise this exercise. You will be surprised how the pencil will want to go still further, until you learn to control your hand properly. Mark your ¼ in. distances with your rule, and draw your vertical lines 6 in. apart with a triangle, which we will now describe, both as to its uses and material.

Usually triangles are made in two styles, 45 degrees and 60—30 degrees as shown at Fig. 5. A represents the 45 deg. triangle, while B illustrates the 60 deg. —30 deg. These instruments are made of wood, steel, celluloid, or rubber, depending on the price. The student's pocket-book capacity can be his guide as to the kind he purchases.

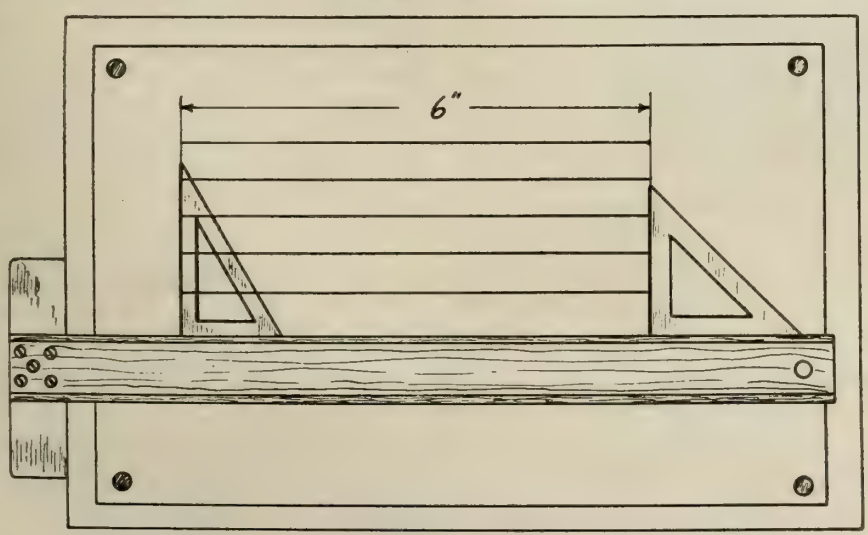

Fig. 4.

PRACTISE LESSON ON HAND CONTROL.

A 6 in. or 8 in., a side size, will be found convenient for most work, and will be ideal for this course. By purchasing a triangle of each style as already described, the student is well equipped for such work as the course will present at the start.

Taking it for granted that the student has now a drawing board, T-square, pencils, rubber, and triangles, we can go ahead with the exercise at Fig. 4.

First practise making the lines A and B 6 inches apart. Draw these vertically by means of the T-square and triangle, either one, as shown. Next use the T-square only, and draw your horizontal lines, meeting the vertical lines, yet not going over them. This is most important, for the exercise is simply one to teach control of the hand. All lines must touch, but not go over, yet be sure of the point, that they much touch. Draw these horizontal lines ¼ in. apart, marking off the spaces with your ruler, or scale, as it is usually called.

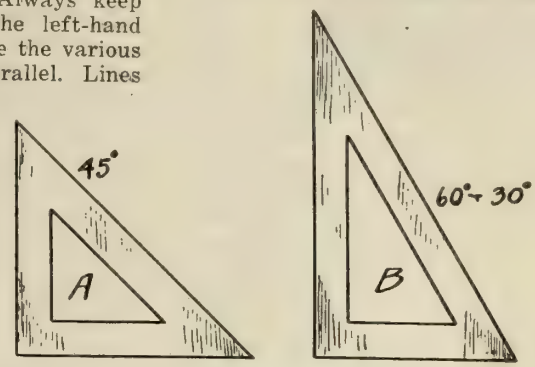

Fig. 5.

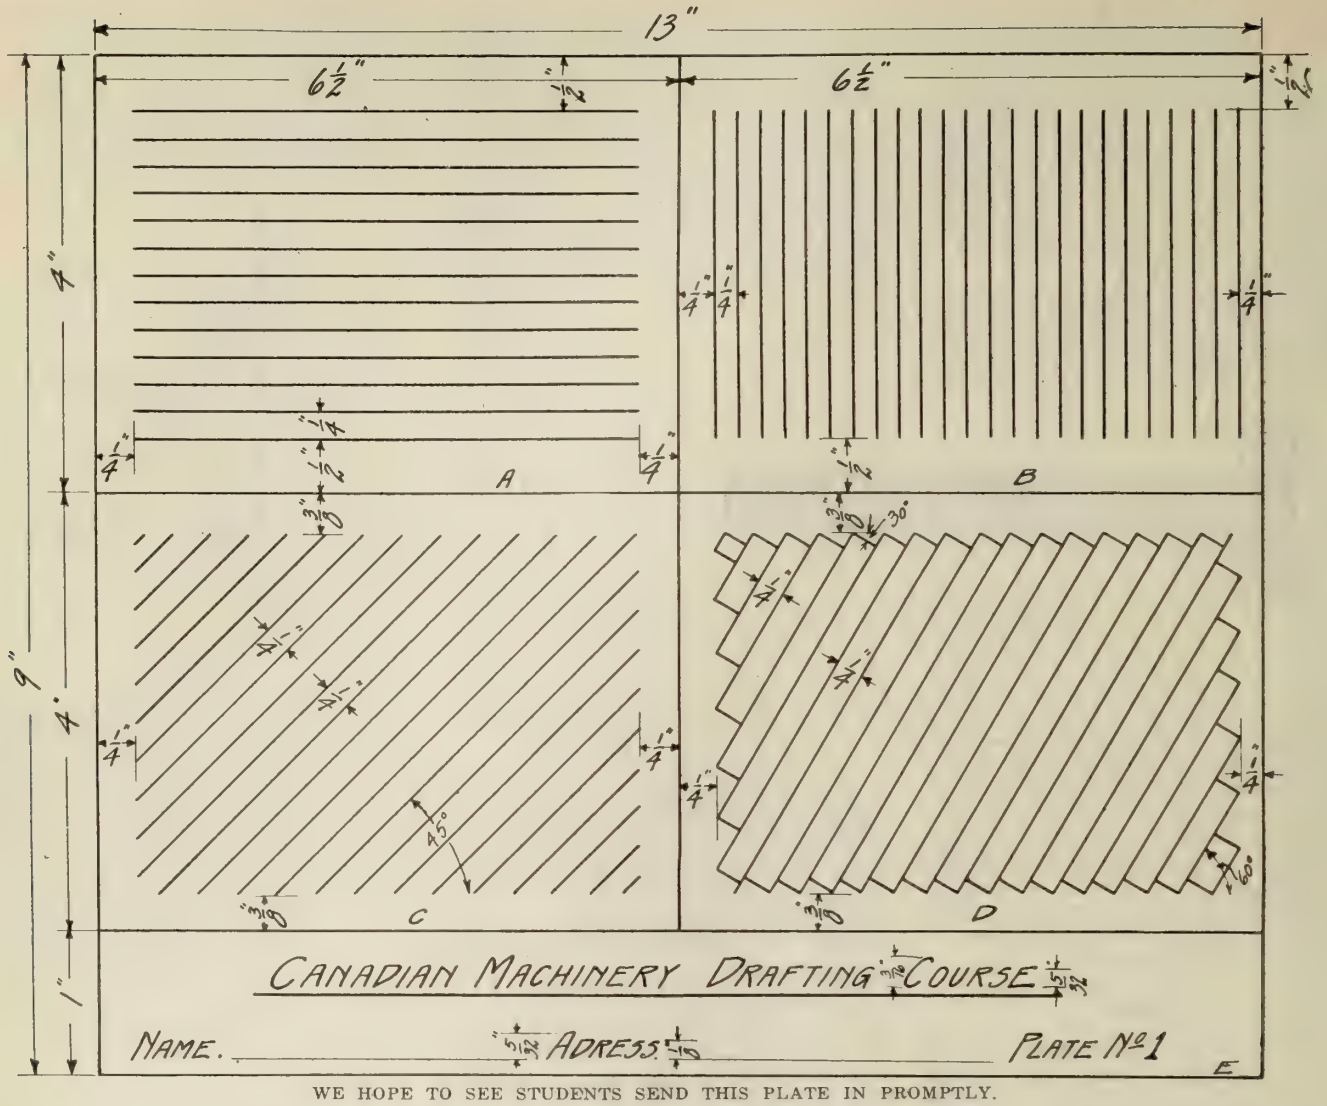
SKETCH OF TRIANGLE.

After you believe yourself proficient enough, study Plate No. 1. To the best of your ability follow the instructions closely, draw up the plate, and send us in your work.

To the three neatest plates received, we will award a prize in the shape of a special 6 in. steel scale, with drill sizes, decimal equivalents, etc., stamped on its face, and in all future issues on this series, will carry out the same plan, forwarding a scale to the three best and neatest plates received on each part or plate.

Instructions

First tack a piece of paper 10 in. x 15 in. on the drawing board, using T-square to see that it is placed on fairly square. Now draw the trimming lines 9½ x 13½ in. Next draw border lines as shown at Plate No. 1, 9 in. x 13 in., and join. Divide the sheet up into 5 sections A, B, C, D, and E. In portion E print in the lettering as shown, and while we do not expect this lettering will be of splendid standard, still it will help you to get ready for the separate lesson to come later in the course. In section A, complete the horizontal lines, each ¼ in. apart as illustrated, stopping ¼ inch away from the border, and dividing lines. In section B, draw up the vertical lines, following out the dimensions given. At section C, draw 45 degree lines as shown, using your T-square and sloping edge of 45 deg. triangle. At section D draw up the 60



WE HOPE TO SEE STUDENTS SEND THIS PLATE IN PROMPTLY.

deg. and 30 deg. lines as illustrated, using your 60 deg.—30 deg. triangle, together with your T-square. In all cases study the plate carefully, and work to the dimensions shown.

Remember that neatness counts. For the drawing of this plate use a 3 or 4H pencil, and make your lines decided, and plain. Send us in your work as soon as you can. We will judge each plate two weeks after its issue, giving you lots of time to send your work along steadily, so get busy with a capital B, and watch for Part 2, which will further explain the various instruments, and their uses. When sending in your plate, use the coupon, and fill the same in carefully. At the same time if you feel so inclined, write us your ideas on this course, and if it appeals to you. We are mighty anxious to make this course of great benefit, so let us hear from you when your work comes in.

In studying the plate, do not pay any attention to the scale shown on the sketch. Work to the dimensions given, and the result will be what we want. We purposely do not give you an exact copy to work from, but rather let you prove that you have followed instructions closely. It is not necessary to ink in this first plate, so as stated before use a 3 or 4H pencil, and make your lines plain and decided.

Tear off and send with drawing

Name .....

Address .....

Firm's name.....

Mail your plate flat, do not fold, or if desired you can roll it up and place it in a regular mailing tube. Be sure you have sufficient postage placed on the same. We will not return plates unless specially requested to. In such cases return postage must always accompany the request. Address all correspondence on this course to CANADIAN MACHINERY Drafting Course, McLean Publishing Co., 143 University Avenue, Toronto, Canada.

The Germans have not the glory of being the original gas-attackers; for a certain kind of beetle has been gassing its enemies for centuries. When it sees a gargoyle-like creature, it promptly ejects an explosive fluid from the last ring on its abdomen.

This fluid smells very much like nitric acid, and consequently is a great help to the beetle in its battle for existence.

The War Department's 15,000,000 excess hand grenades are to be remodeled as penny and dime-savings banks, and will be distributed to schoolboys and girls who can show one or more War Savings Stamps earned during the coming summer.

WELDING AND CUTTING

Milling Machine versus Oxy-Acetylene Machine

An Interesting Description of the Work Done by a Straight Line Cutting Blowpipe in Cutting Slots in a Slip Socket—The Dimensions of Same Deserve Attention

THE cutting of slots or openings in steel or wrought iron is a machine shop operation that requires a great deal of time when performed by milling machines, drill presses, broaching machines, or any of the other machine tools. The cheapest known method of performing the operation is by means of the oxy-acetylene cutting blowpipe. Such cutting can be done free hand with surprisingly good results, but where an absolutely true cut is desired, it is advisable to use an Oxweld straight line cutting machine, Fig. 1. The cut made with the aid of this machine is as true as a cut made by any other method, and almost as clean, in fact for most purposes it is sufficiently clean without any further finishing operation. Even in the few cases where finishing is necessary in order to obtain an absolutely square edge, the time gained by roughing out with the blowpipe constitutes a big saving.

A very interesting example of this sort is furnished by Fig. 2. This picture was taken at the plant of the Acme Finishing Tool Company, Parkersburg, West Virginia, and shows slots cut out with an Oxweld cutting blowpipe, which were formerly cut at a much greater cost by means of a milling machine. This operation as applied to slip sockets, which are tools used for the purpose of "fishing" churn drill tools out of oil or gas wells after they have broken loose from the drilling rope.

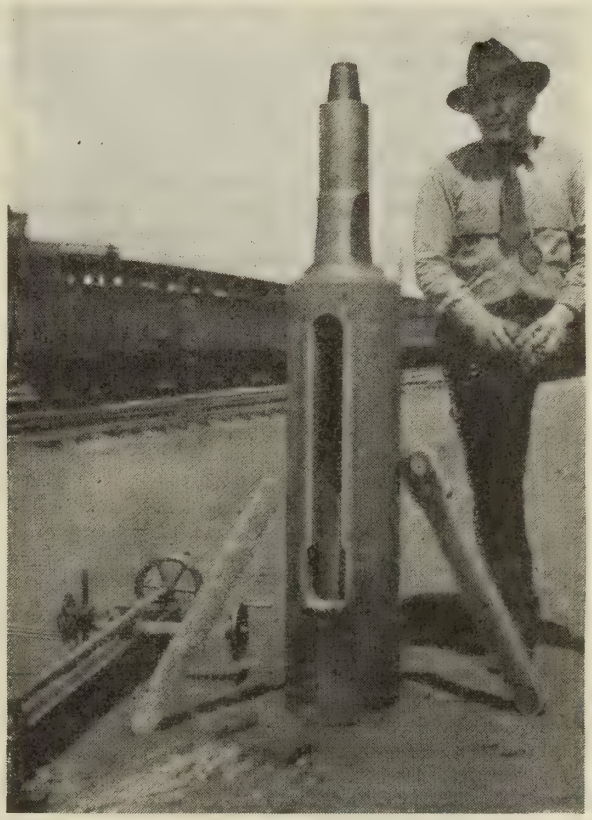

FIG. 2—SHOWING SLOTS CUT IN SLIP SOCKET. THIS PIECE WEIGHS 1600 POUNDS.

The steel slip socket illustrated in Fig. 2 weighed 1,600 pounds. The pieces cut out by the oxy-acetylene blowpipe were 3 inches in thickness, 26 inches long, 4 inches wide up to 6 inches width at wide end. The cutting was done with

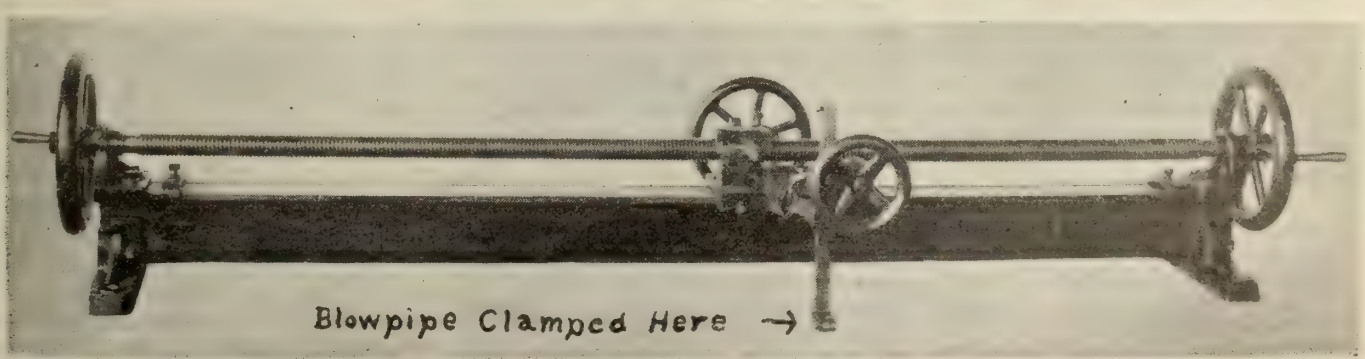

FIG. 1—A GENERAL VIEW OF THE OXWELD STRAIGHT LINE CUTTING MACHINE.

the aid of the Oxweld straight line cutting machine, which held and guided the blowpipe, feeding it at a uniform rate of speed. By the aid of the straight line cutting machine the cutting was done so smoothly that no finishing was necessary. A cut of this sort is very easy to make, the rounded ends being the only parts causing any difficulty whatsoever.

Each of the two cuts was completed in eight minutes. Formerly it required one machinist eight hours to make both cuts on a milling machine; in other words the new method requires one-thirtieth as much time, and it is estimated that the net saving per socket by the use of the oxy-acetylene process amounts to $25.

Acetylene in Chemical Warfare

By MAJOR-GENERAL W. L. SIBERT, U.S.A.

Address delivered before the 1919 Convention of the International Acetylene Association.

WHEN I was in the Philippines and was confronted with the necessity of learning the Tagalog names of the cities and towns on the maps of that region, I felt that I could never accomplish it. Later, in China, when I had to have on my tongue's end such names as "Hwangho," "Yangtze kiang," "Chinkiang Pu," etc., I felt as if I were in a more hopeless condition than when in the Philippines. But when I first gathered together the representatives of the 1,000 research men of the Chemical Warfare Service, and they commenced to talk about diphenylchlorarsine, diphenylamine arsine, brom benzyl cyanide, chlorpicrin, etc., I felt more helpless than I did in the Philippines or in China, and told them that while all those things might kill Germans and win the war, they had to limit the substances to the number of names that I could remember.

I can understand why the doctor who depends often upon the psychological effect of things still adheres to Latin names, but the chemist ought to simplify his nomenclature if he expects the support of the everyday man.

I do not know anything about acetylene, except the uses to which the engineer puts it in cutting up and welding steel with the oxy-acetylene flame, and by the use of an acetylene light converting night into day.

I remember in Panama when the work indicated the necessity of transferring a dredge from the Atlantic side of the Isthmus to the Pacific side, and it was not practicable to tow it around the Horn, a plan was adopted of dismantling the dredge, cutting the hull on cross section into pieces that could be handled by a wrecking crane, loading them on cars, shipping them across the Isthmus, reassembling them on ways, and riveting a steel batten over the cracks; all of which was possible on account of acetylene.

My mind within the last year has been drawn to the necessity of chemical development in every direction in this country. When one looks back he must appreciate the absolutely helpless condition the United States would have been in prior to 1917 had it been called upon to prosecute a war with a great nation, and had it been unable to control the seas. Its effort to resist a foe would have been on a par with that of China. It would not have had powder enough to last two weeks, and would have had no nitrates out of which to make more. The absence of a dyestuff industry with its by-product coke-ovens, would have limited the supply of raw materials for the manufacture of explosives and gases. Future will be more and more chemical wars, more and more scientific, and the nation that has developed its chemical possibilities will enjoy a great advantage.

One of the big questions presented for solution to-day in this country is chemical preparedness for war, through the development of chemical industry that has peace application.

There is nothing to indicate that Germany, prior to the war, had made any systematic arrangement to utilize her dye factories for war purposes, because many of her chemists were in the beginning called into military service. This and many subsequent developments of chemical plants for war needs causes one to think that Germany confidently expected the war to end in a very few months, that she had sufficient materials in storage, and that her mind was not turned to the full utilization of the chemical resources of the nation for the support of the army, until after the results at the Marne.

There is one notable exception to this, and that is the development of the processes for the production of ammonia from atmospheric nitrogen. It was not until the end of 1912 that there was any large scale production of ammonia by this method. In other words, the great war was not brought on until the way was clear—that is, it was not brought on until Germany could produce within her own boundaries a supply of ammonia and nitric needed in the manufacture not only of her propellants, but also for the fertilization of the land, so as to make the feeling of the army certain.

When it became apparent, after the battle of the Marne, that the available supply of material for the manufacture of suitable propellants and explosives would soon be exhausted, it was then that the great chemical establishments of Germany were called upon to convert their plants, that had been utilized in making dyestuffs, into high explosive plants and gas plants; it was then that the chemists that had been drafted into the army were returned and utilized with existing plants and with necessary extensions—all in order that the needs of the army might be met. The existence of this great potential reserve made Germany a powerful adversary.

It is a peculiar fact that if you probe nearly any line of chemical industry you will find that it has a war application as well as a peace application. You gentlemen are engaged in the carbide and acetylene industry, and while I am not a chemist, I would take a few minutes of your time to mention some of the ways that our people think the manufacturing plants for acetylene may be a preparation for war. Of course, the ordinary uses of it, the process of welding and cutting steel, and its use for signal flares and illuminating processes, need not be repeated. The use of burning acetylene to light the fields of England in order that all the land possible might be planted, is merely an extension of a well-established use.

The great development of airplanes in this war called for a large supply of acetone for the preparation of airplane dope. The synthesis of this chemical commodity as well as acetic acid, beginning with acetlyene as a starting point, is now a commercial reality. The Government expended over $100,000,000.00 in its nitrate plants, which nitrates were to be used in making propellants and fertilizers, both in times of peace and in times of war. The largest of these nitrate plants utilized the cyanide process of fixing nitrogen, and this audience need not be told that cyanamide in turn is prepared from calcium carbide.

Mustard gas is prepared from ethylene, which is usually prepared from alcohol. Have we not in acetylene a raw material from which ethylene can be prepared on a successful commercial basis? Further research and development may establish such a fact. In fact, our research people tell me that the entire subject of the chlorination of acetylene, and the preparation of its chlorine derivatives, is one that should be carefully investigated, not only from the standpoint of chemical industry in times of peace, but also from the standpoint of the preparation of raw materials for war needs.

The interaction of acetylene with phosgene, with arsenic trichloride, with stannic chloride, and with antimony trichloride, are all fertile fields for investigation. It is apparent, therefore, that we have in the acetylene industry, an association with war problems which may be as important as the association of the coal-tar chemical industries with such problems.

What the Government needs is chemical industry in every line that nature has made it commercially practicable to develop. We want to be in the same position that Germany was in during this last war, so that whenever research indicates that some new substance or some substance hitherto not manufactured, has a military value, the heads of the chemical interests of the country could be called together and given the problem with the full expectation that they could solve it and would solve it. that some existing chemical plant could be changed into one suited for making this substance, that the various well-

tried research establishments could soon overcome any difficulty in its manufacture, and that there would always be a personnel available for such manufacture; because this war has shown more strongly than it has shown anything else, that a country without an extensive organic chemical industry will be seriously handicapped in war against the nation that has such industry.

Of course there is no need for me to tell this audience these things. If they stop to think they will know them. But it is always well to impress upon people that there is a public use that might be made of their appliances when their country is in need, because the average man takes pride in assisting his Government when it is in need.

This country needs now to develop a certain and sure nitrate supply; it needs to develop large dyestuff industries; it needs to have its acetylene industries developed and protected, if need be against hurtful foreign competition.

Chemical warfare, as such, made its first appearance in this war. It probably caused more casualties than any other single implement in the war. It has in it more possibilities than any adopted implement of war. If the Chemical Warfare Service of the Army keeps closely in touch with all of the chemical industries of the land, if such industries are sympathetic with the needs and aspirations of the Government, and each of them exchanges research information of value to the other, and if the Congress of the United States insures the development of such chemical industries, we can trust to the ingenuity of our chemists and chemical engineers to see that his country enters no future war except upon equal terms with any adversary, in so far as chemical warfare is concerned.

Had the Germans known at Ypres the effect of the first chlorine cloud that they passed over the allied lines, and had they had confidence in their own protective devices and followed closely such chlorine cloud, they could have penetrated to the channel ports—all of which shows what the surprise use of a chemical substance means.

Although the gases used in the great spring drive by the Germans in March and April, 1918, were known gases, the new tactical use of gases made possible through Germany's ability to make them in great quantities almost caused a German victory. By saturating the strong points of the line with mustard gas for 48 hours before an attack, back to a depth of five or six miles, and by saturating the road crossings through which reserves and ammunition must pass, one of the English armies in the first onset in March was largely paralyzed —its strong points were made ineffective, and the weak points easily taken.

The inspection of the German gas plants in the Rhine district indicates that this country has nothing to fear in the chemical world provided competition is fair and protection is the same. I wish the statesmen of this country could visit Edgewood Arsenal, and see what our people can do when put to the test.

AN IMPORTANT AFFILIATION

Continued from page 342

the students and sponsors of the department of Industrial Medicine will be tackled at the industrial research laboratory.

This plan being carried out jointly by the College of Medicine of the University of Cincinnati and the Cincinnati Local Council of the National Safety Council which represents the first attempt in America to train doctors for industrial work, in the opinion of C. W. Price, general manager of the National Safety Council, promises much for other cities.

"The Cincinnati plan grew out of a very definite need," Mr. Price said. "During recent years there has been a great call for industrial physicians but there was no institution that gave special instruction in industrial medicine. The new department of industrial Medicine and Public Health of the University of Cincinnati special courses for the training of industrial physicians and surgeons are now being offered. In connection with the regular medical courses the student will be given instruction in industrial medicine, shop sanitation, occupational hazards and diseases, labor economics, labor conditions and problems, industrial relations, accident prevention and employment. "The product of this special training will be not merely an industrial physician, but an executive who in the larger plants can take charge of an Industrial Relations department that would include, the safety engineer, the plant physician, the employment manager and others. The men who receive the special training offered at Cinninnati also will fill a long-felt want among the smaller industrial plants where conditions do not justify the hiring of a safety engineer, a physician, and an employment manager. In such a plant all three of these positions could be filled by one man with the training now available at Cincinnati."

Dr. Carey P. McCord, who did notable work in organizing and conducting military hospitals during the war has been appointed director of the Department of Industrial Medicine and Public Health of the University of Cincinnati. The National Safety Council will be repreented at the school by C. H. McLain, formerly safety engineer and assistant to the supervisor of labor at the Dayton Electrical Company, Dayton, O., who has been appointed secretary of the Cincinnati Local Council of the National Safety Council.

The Cincinnati plan provides for the co-operation of the National Safety Council, not only with the University of Cincinnati, but with the general educational system of that city. The secretary of the council will give twelve lectures on school and public safety in the teachers' college of Cincinnati, so that the teacher in making will be prepared to pass on such instruction to young America. Later, a similar series of lectures will be given to a class made up of one of more teachers from each public school in Cincinnati so that she in turn may acquaint fellow-teachers with the fundamentals of education in accident prevention.

Finally, a course of safety lectures similar to that given at the National Safety Council's schools for safety supervisors at St. Louis, Cleveland, Pittsburgh and Rochester will be given to every class in the Engineering School of the University of Cincinnati.

An entire general session and two sectional meetings of the Eighth Annual Safety Congress of the National Safety Council, which is to be held at Cleveland, O., October 1st to 4th, inclusive, will be devoted to discussion of health service in connection with organized accident prevention work.

The program of the congress, just issued, lists 160 speakers, including some of the men most prominent in the practice of industrial medicine. It is expected that more than 3,000 safety engineers, industrial physicians, plant managers and others interested or actively engaged in the work of accident prevention will attend the congress.

Dr. Charles A. Lauffer, medical director of the Westinghouse Electric & Manufacturing Company, will preside at the general health session on the afternoon of October 3 in the ballroom of the Hotel Statler at Cleveland, and at the health section meetings during the mornings of October 3rd and 4th.

While not generally known it is a fact that during the nineteen months of our participation in the war with Germany, the casualties from accidents in peaceful America were more than twice as great as the casualties among the American troops in France. The statistics of the United States census show that more than 70,000 persons died each year as the result of accidents in America. It is estimated that 20,000 of these deaths are caused by industrial accidents and 50,000 by accidents in the streets and homes.

It has been the experience of men and women engaged in organized accident prevention work that a large number of the deaths attributed to accidents result only indirectly from accidents and more directly from causes than can be eliminated by health education. The National Safety Council and the 3,300 industrial concerns included in its membership are, therefore, giving more and more attention to health education and health service in the war on accidents.

An Imperial Mineral Resources Bureau has been established in London, charged with the duties of collecting information regarding the mineral resources and metal requirements of the British Empire and of giving advice to the Government authorities in reference to the same. The Bureau is to be directed by a board of governors, comprising one appointed by the Home Government, who will serve as chairman, one by each of the five self-governing dominions, one each by the Government of India and the secretary of state for the colonies, and six representatives of the mineral, mining and metal industries.

WHAT OUR READERS THINK AND DO

Another Outburst on the Parting Tool Question

We Invite Readers to Send Us Their Practical Experiences. There is No Reason Why This Page Should Not Go Strong, so Send Us Your Ideas, and When Published You Will Be Paid For the Same

CURLING OF THE CHIP

J. H. RODGERS

In the setting of parting tools one of the most important factors to consider is the relative position of the cutting edge to the direction of the feed.

Some operators advocate a slight rounding of the nose, so that the edges of the chip will tend to curl to the centre as the tools advance to the work.

This method frequently assists the easy cutting of the metal, but the essential point to keep in mind is that the neutral line of the cutting edge—be it slightly rounded, or perfectly flat—should be at right angles to the direction of the feed; in other words, parallel with the axis of the lathe. The sketch will show the advantages of the above suggestion.

If the cutting edge is at an angle with the centre line, be it ever so slight, the chip will curl at right angles, forcing the cut metal against the edge A.

As the particles break off, they work down between the side of the tool and the slot, and force the tool to spring in the direction of the arrow, thus causing the side of the tool to bite into the side of the groove.

If the tool is not strong enough to stand this additional stress, breakage will follow.

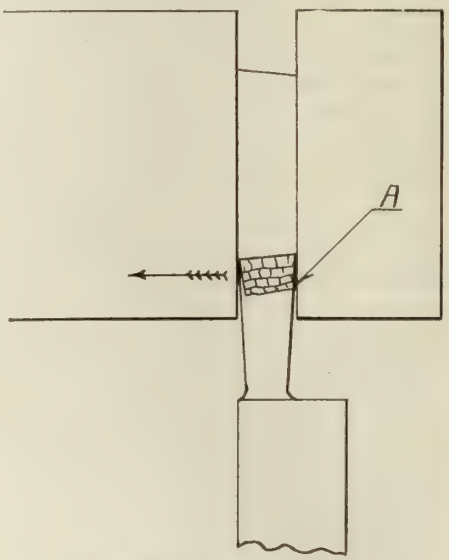
Clearance, rake, and set of the parting tool are essential to good results, but this feature of the curling of the chip must not be overlooked, otherwise the work performed will not be satisfactory.

ANOTHER VIEWPOINT

In your issue of July 17, on the subject of parting tools, I am one reader who does not coincide with the views of the author. First of all I could not say that "The most peculiar thing is the lathe nearly always gets blamed in connection with parting off stock." As I have seen troubles in that connection in shops where the parting is done entirely with saws (which is the best method where there is any depth of cut and wherever practicable).

As I presume the discussion is on what is commonly known as the parting tool, however, I will not say any more about the saws. As to the ordinary forged tool being the best, I would modify Mr. Ernest's statement and put it in this way: That it is the best for lathe shaper or planer where there is any depth of cut to be taken.

I agree that there must be clearance from the cutting edge in every direction, front, top and sides. The corners should have all the support that it is possible



THIS IS MY THEORY.

to give, and still have clearance about one degree on each side away from the corners, front clearance about five degrees for the lathe tools and three degrees for shaper and planer tools. There should be a lip ground on the top about ⅜ of an inch radius, deep enough to make the top slope from cutting edge about twelve degrees. Care must be taken in the setting of the parting tool to get the support as directly under or behind the cutting edge as possible, as the more overhang, the more apt it is to break.

The flat steel with the Armstrong holder is a very handy tool to have around the lathe or shaper where the parting cut is not very deep, but it does not take the place of the forged tool entirely. I would not recommend the method of peening the edge with a hammer as I prefer to find the blades too hard to do that; like the forged tool, you will find that grinding a slight lip it gives better results, and as the stock used in the Armstrong holder has about one degree clearance on each side by having a lip it leaves the cutting edge a little wider than the bottom of the lip, when you take this tool to the blacksmith and have it upset that defeats its purpose I would avoid this and keep the tool for the work it is best adapted for.

I have found that the ideal position of setting a parting tool is (whether it be single or double) the one commonly used in special cutting-off machines, where the tool holder is shaped on the side nearest the chuck to take flat stock, held firmly by a clamp on top, the tool is set on a slope of 13 degrees, this position giving the cutting edge the best support; being ground straight on top gives the same effect as a lip on a tool that is set horizontal. The front is ground at an angle of 18 degrees. This type of tool can stand more side clearance than the ordinary forged tool. For heavy work, such as cutting off billets for shells ¼ in. by 2 in., flat stock was used; this can be upset to ⅜ in. wide at the point and be used until it is less than 5-16 of an inch, keeping the same clearance away from the cutting edge always.

It will be found that when this type of tool is used single, it should be set with point a little above centre so that any spring or slackness there might be is taken up and it is working at centre.

A simple method for upsetting these tools is to cut a piece out about half the width of the tool and ½ inch from the end, leaving a shoulder to rest on the anvil, flattening out the point, then turned over with top of tool on anvil, then hammered on sides and end, reheat and cut off the corner.

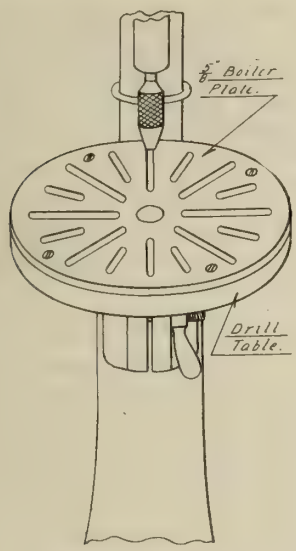
It is now ground to shape and hardened In conclusion I would say that

the most important points to be observed about the parting tools are that the cutting edge has clearance in every direction and that it is well supported in both grinding and setting.

DRILL TABLE PAD

By Chas. H. Willey

A simple idea like this one shown in the sketch may save some reader many dollars if he adopts it. It saved many for the writer, so I pass it along. The drill press table when new is perfectly



DRILL TABLE PAD

smooth and true, and inside of six months, if all hands are allowed to use it at will, it becomes sadly abused, scratched, scarred, nicked, drilled into, and otherwise ruined as far as being able to set up and drill accurate work. Eventually it means a new table will have to be gotten. To protect the table in the first place would be best, so when we installed a new drill I obtained a piece of ⅝ boiler plate and made a false top for the table and bolted this on. It is never removed except when fine, accurate work is to be drilled.

AN EMERGENCY LATHE NUT

By J. H. Houldsworth

It might be interesting to tell readers of CANADIAN MACHINERY how I made an emergency nut for the compound rest of a lathe which we wished to get into commission again at the earliest possible moment.

Having no time to cut one on the lathe, we secured an iron plate, and drilled a hole central in this plate, an exact fit for the spindle. In the case in point the size was 15-16 in. diameter.

Referring to the sketch, the remainder of the scheme is easy to explain.

We now constructed a framework of wood and placed the old nut on the spindle, then stood the assembled spindle as shown. We now made a regular mould of the affair, packing loam (or fireclay if desired) inside the framework constructed. We now withdrew the spindle and nut, removed the nut, and replaced the spindle in the central hole; we now poured a good grade of hard babbitt into this mould, when we had a good temporary nut to operate our lathe until such time as we could make a permanent one.

A KINK IN LAYING OUT WORK FOR THE SHOP

By F. A. McLean

The most widely used methods of preparing work for laying out are probably those in which chalk is used for coating rough surfaces, and copper sulphate solution for finished surfaces or template work.

Both of these methods have limitations, as the copper sulphate is no good for rough surfaces, and chalk is of little use on finished work, and in either case the chalk often gets rubbed off, making the marks hard to distinguish.

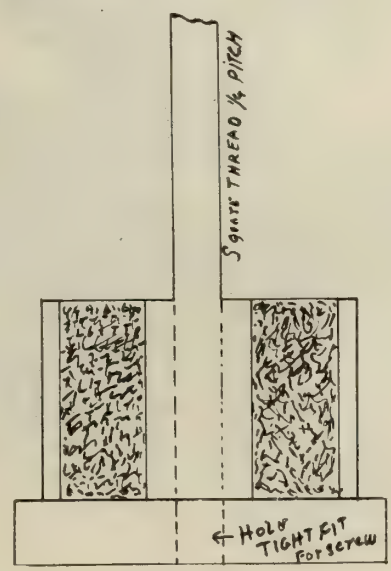
The use of a whitewash made of whiting dissolved in water will be found much more efficient than either of the methods just mentioned, as it will make a smooth coating on either rough or finished surfaces, and is not liable to be rubbed off accidentally.

More surface can be covered in less time as two applications of the brush will cover a surface that would require several minutes to coat with chalk or copper sulphate.

OIL CUP FILLER

By Chas. H. Willey

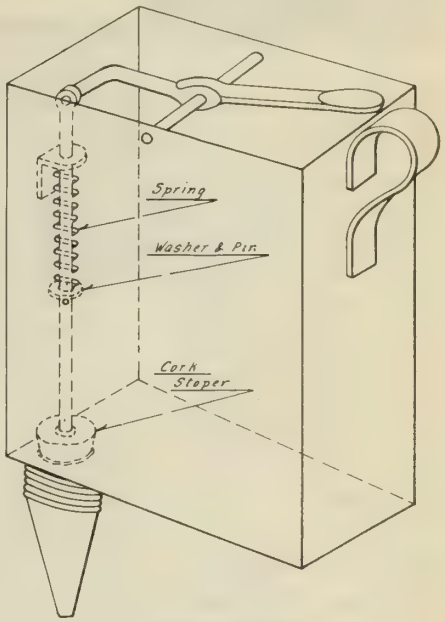
Here is another scheme for using up empty 1-gallon oil tins, and the device shown in the sketch is one that will be found advantageous in filling oil cups and reservoirs.



HOW THE NUT WAS MADE.

To make it, the bottom of the oil container is cut out and then the arm and levers are made and fitted in. The place on the top edges of the device where the rocker shaft turns is reinforced by soldering on washers. The levers and fittings are very simple to make from ¼-inch rod, the joints being made by flattening and drilling, and the spring is made from small size brass wire.

A funnel of small dimensions is soldered into the screw cap opening and the flow of the oil is controlled by the pressure of the lever which raises the cork that is secured to the end of the ver-



OIL CUP FILLER.

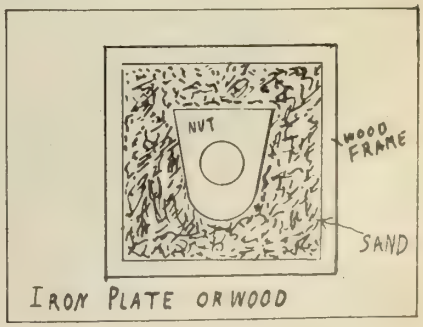
ticai rod. The sketch conveys the idea in clear form.

The Woodman and his axe are giving way to the engineer and his dynamite, for dynamite works much more easily and quickly than does the axe. You tie dynamite around the tree-trunk, then attach a fuse to it and set it off. Down comes the tree.

Colored Patient (in hospital)—"Boss, how do you all do yoh cookin in thah?"

Orderly—"Well, Sam, you know we have the latest fandangled methods over here; we do our cooking by electricity."

Colored Patient—"Hum, by e-lectricity, huh? Well, boss, you sho' ought to have given dem beans anotha shock."—Truth.



DEVELOPMENTS IN SHOP EQUIPMENT

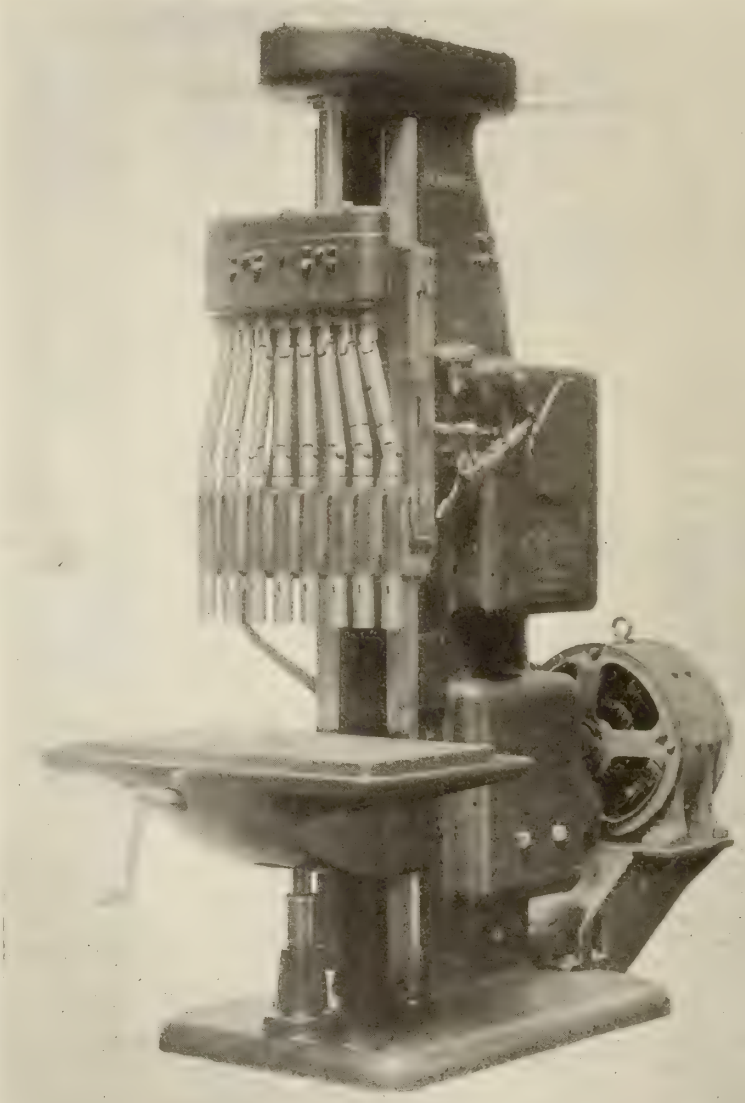
THE No. 10 multiple spindle drilling machine—with straight line adjustable spindles—as shown by the illustration on the opposite page, has been designed with improved features incorporated to meet the extensive requirements in a production machine for multiple drilling operations. This machine can be equipped with a group of spindles —with fixed centres— arranged in a straight line or in a cluster, or with a group of universally adjustable spindles arranged in a straight line, a rectangular or circular cluster.

The Speed Mechanism

The speed mechanism is located in the column near the base so that vibration, ordinarily excessive in a belt-driven machine, is entirely absorbed. Power is transmitted to a vertical drive shaft from a three-step cone pulley through back gears and hardened steel bevel gears. A Johnson friction clutch is used to engage the power and to select the back gear, and these back gears, when used in conjunction with the 3-step cone pulley allow six speed changes. The vertical drive shaft is fitted with a sleeve gear through which the spindles are driven, and this sleeve gear is made to slide along the drive shaft with the spindle head as it is fed either up or down, which construction provides a drive closely coupled to the spindle head at any position on the column. Back gears are unnecessary and are not furnished when the machine is arranged for a direct connected variable speed motor.

The Feed Mechanism

The feed mechanism is driven from the drive shaft through hardened steel bevel gears, and is housed in the column above the speed mechanism. It consists of two friction clutches and a jaw clutch. The friction clutches are immersed in a bath of oil, the end thrusts being taken by S. K. F. ball bearings. By engaging one of the friction clutches the spindles are rapidly advanced until the drills come in contact with the work, at which point the jaw clutch is automatically engaged to feed the drills through the cut. When through the cut the other friction clutch is automatically engaged to effect a quick return of the spindles to the starting position. The levers operating these clutches are interlocking, which prevents the possibility of more than one clutch being engaged at the same time. With this system of feeds, work having obstructions above the drilling plane, which the drills must clear when in a raised position, is accomplished with a minimum loss of time. Feed changes can be made by merely removing a gear case cover and changing two gears.



GENERAL APPEARANCE OF THE MACHINE.

The Feed Screw

The feed screw is large in diameter and of substantial pitch. It is operated by the feed mechanism through a vertical drive shaft and a train of spur gears. The threads on these screws are engaged by a hard bronze nut, which is immersed in a bath of oil and located low in the spindle head to prevent the threads from being exposed when the head is fed to its lowest position on the column. The advantage of this screw feed, which is located directly above the work, lies in obtaining an absolute vertical feed-thrust in central alignment with the spindles, thereby eliminating all side thrust to the spindle head and column ways and maintaining them in their original true alignment for a long period of use. End thrusts on this screw are taken in both directions by large S. K. F. ball bearings.

The Spindle Head

The spindle head is a substantial casting of box construction and is securely gibbed to the column by a square lock method. This head supports the spindles and retains the spindle drive gears. Each spindle, when arranged to be adjusted, either universally or in a straight line, is connected to the drive gears by a telescopic drive shaft fitted with universal joints. When the spindles are arranged

with fixed centres they are connected with the drive gears in a more direct manner without universal joints. The universally adjustable spindles are supported by substantial brackets, which are fastened in two "T" slots to a planed flange located at the lower end of the spindle head. Straight line adjustable spindles are supported by L-shaped brackets which are fastened to a cross-rail. The thrusts on all spindles are taken by S. K. F. ball bearings.

The Table and Column

The table and column are cast of a close-grained gray iron, and are of sufficient weight to ensure rigidity. The table can be furnished in either a knee or box type. The knee type is gibbed to the column by a square lock method, and is adjustable vertically. This adjustment is obtained by means of a crank lever, which, through a spiral gear mechanism, actuates a heavy jack-screw. The box type table is made with its top surface provided with "T" slots, to which the work or a jig can be clamped. The bottom part of this table is fastened to a planed surface on the base, which is also provided with "T" slots.

The Oiling Method

The oiling method—consisting of a force feed, gravity flow and splash system combined—is made possible by the all-enclosed unit construction. The speed and feed mechanisms taken collectively, and the spindle head separately, are each provided with independent and self-contained oiling systems—which ensure positive lubrication, and, as a consequence, economical maintenance. Each of these units are tightly encased and partially submerged in a bath of oil, while the bearings are lubricated by a force feed through individual leads which carry a sufficient flow of oil to flush all enclosed parts on its return to the reservoir.

Extra Attachments

Extra attachments, such as hand-feed for the spindle-head, motor drive, holding fixtures and tools, and equipment for cutting compounds or lubricants, including pump, tank and pipe fittings, can be furnished, but are not included in the regular equipment of this machine.

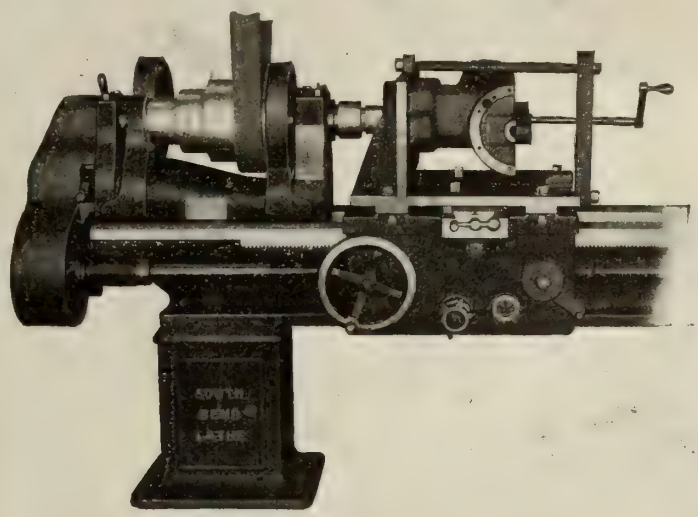
Following are its Principal Specifications:

Capacity	Eight ¾" holes
Minimum distance center to center of spindles	2"
Maximum distance center to center of spindles	22"
Vertical adjustment of collet in spindle	¾"
Diameter of spindle nose	1 31/32"
Morse taper in spindle	No. 3
Diameter of joints	1¾"
Maximum distance nose of spindle to base	44"
Minimum distance nose of spindle to base	30"
Maximum distance nose of spindle to table	32"
Vertical travel of spindle head	14"
Distance center of spindle to column	9.970"
Table—vertical adjustment	12"
Table—working surface	20" x 36"
Back gear ratio	1 to 2
Spindle speeds—six	110, 137, 172, 220, 275, 344 R.P.M.
Electric motor—speed variable	500 to 1500 R.P.M.
Width of belt used	4"
Feeds—change feed gears to suit character of work	

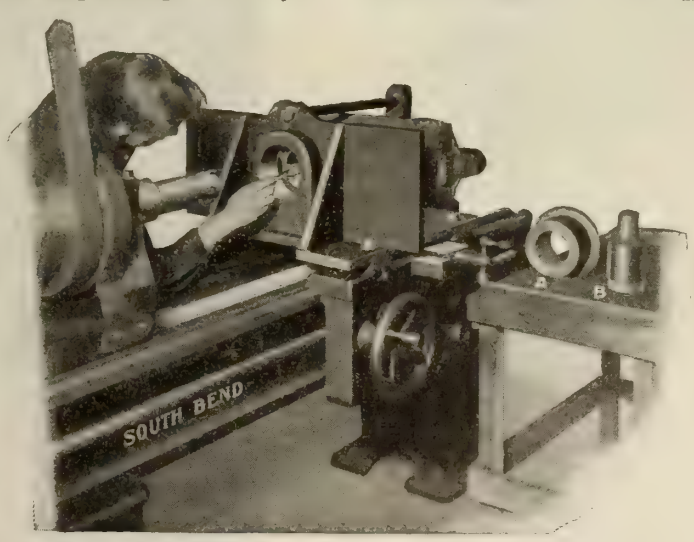
Any further information on this machine can be secured from the makers, the Defiance Machine Works, Defiance, Ohio.

SOUTH BEND CYLINDER-BORING ATTACHMENT FOR LATHES

The South Bend Lathe Works, 425 East Madison Street, South Bend, Ind., has just placed on the market an attachment by means of which any of its lathes can be quickly set up for reboring the cylinders of automobile engines. The illustration shows the attachment in place on a 21-in. lathe, but the device is applicable to all lathes of 15 in. or larger. In putting the attachment in place, the compound rest is removed from the saddle, the jib being secured in position by means of two taper pins and bolts fitting the T-slots in the carriage. A feature of the device is the method of locating the work. There is a hole in the attachment in line with the lathe spindle. This hole is fitted with a removable bushing which is in its turn fitted with a plug, on the end of which a shoulder is turned of the same size as the cylinder bore. This bushing and plug are put in place with the end of the plug projecting through. The cylinder is placed over this plug and clamped in place, after which the plug and bushing are removed, allowing the work to be done. The boring bar fits into the taper of the lathe spindle and is provided with a cutting tool that will bore holes 3½ to 4 in. in diameter and can be adjusted to the thousandth of an inch. If larger cylinders must be rebored a collar can be fitted in the end of the boring bar to hold cutters of larger size. The attachment is said to be of great value where cylinder boring is only done occasionally, as it can be easily put in place or removed from the lathe.



GENERAL VIEW OF THE FIXTURE.



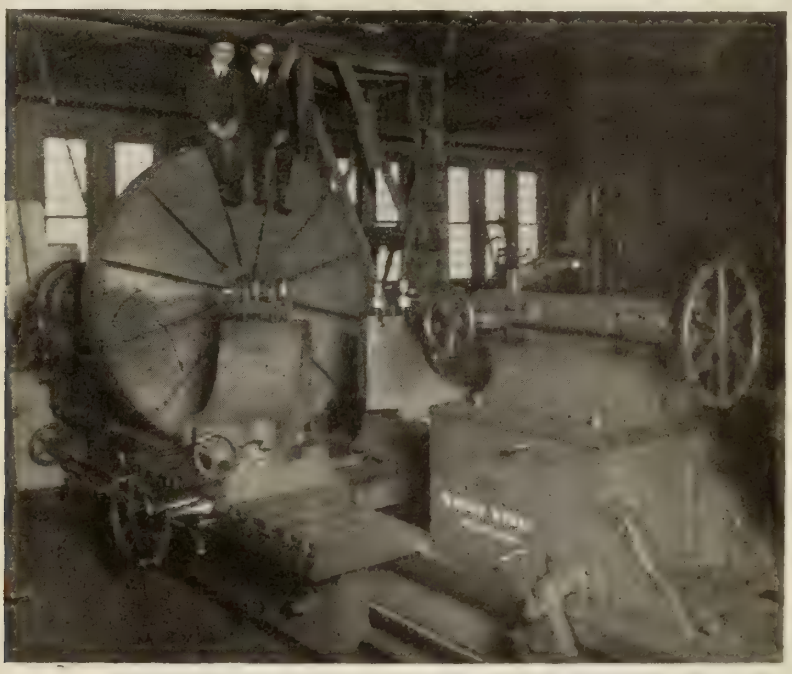
CLOSE UP VIEW OF THE FIXTURE.

A most ingenious little night lamp has been introduced by an American manufacturer of fixtures. This device is made of porcelain, and of an odd shape strongly suggesting a Japanese type of lamp. The shade is made an integral part of the base. In the base is a step-down transformer, which reduces 110-vole alternating current to 6 volts, so as to furnish current for a six-volt two-candlepower automobile type bulb. A simple switch is provided for turning the light on and off.

This little night lamp furnishes just sufficient illumination for dimly lighting a medium-sized room, and the bulb is properly shielded so as not to be troublesome. The current consumption is so slight as hardly to make the average meter register.

96 IN. FIFIELD ENGINE LATHE

What is said to be one of the largest lathes in the world, a 96 inch swing triple-geared Fifield, has just been produced by the Wright Works, 1150 S. Washtenaw Avenue, Chicago, Illinois. The machine is depicted in Figure 1, which shows a front view of the lathe with faceplate removed. The machine is cone-driven from a backshaft, this procedure being necessary to obtain enough power to take the heavy cuts which a device of this size would be subjected to. An eight-inch belt from a countershaft running at 200 r.p.m. transmits forty horsepower to the spindle of the lathe. To reduce chattering, the spindle is made of cast iron. The theory of using cast iron is that it is less elastic and therefore will not spring on heavy cuts and thus reduces chattering. To compensate for the strength of the steel spindle the spindle is of generous proportions, the front bearing being 16 in. diameter and 24 in. long and the rear bearing 14 in. diameter and 20 in. long.



GENERAL APPEARANCE OF THE LATHE.

The lathe is triple geared and all changes are obtained by moving the hand-wheel, which is conveniently placed in front of the cone pulley, thus making all changes within easy reach of the operator. The handwheel is geared to a lever shaft, which reduces materially the effort required to shift the back gears into their desired positions. Only one of the changes is through sliding gears, the balance being by means of massive tooth clutches. The gearing and cone pulley is designed so that all speeds are in geometrical progression, the slowest speed being 0.75 r.p.m. and the fastest speed 76 r.p.m. Twelve speeds are obtainable through the four steps cone pulley and triple gearing with a ratio of 1.52 between each speed.

All of the gearing in the headstock, as well as throughout the machine, are made of steel and the pitch and width of face gears increase in proportion to the load which the teeth have to stand in reducing the backshaft speed to turn the faceplate at the slow speeds required when turning large diameters. The triple gear which engages the faceplate internal gear is of one diametral pitch and has a face width of six inches.

Every shaft in the headstock runs in phosphor bronze bearings and is well lubricated by means of sight feed oilers, which are in the operator's sight at all times.

The feeds are also in geometrical progression and are obtained from a quick change gear box, which is integral with the headstock. They are manipulated by means of the two levers shown in the illustrations, which move in either direction, giving four feeds of 0.025 in., 0.050 in., 0.100 in., and 0.200 in. per turn of faceplate. More feed may be had by changing the regular feed gears with the thread cutting gears. Twenty-four different threads may be cut by means of changing gears. All the gears are guarded by covers or guards, which are made conveniently removable where necessary, while the change gear guard is provided with a door.

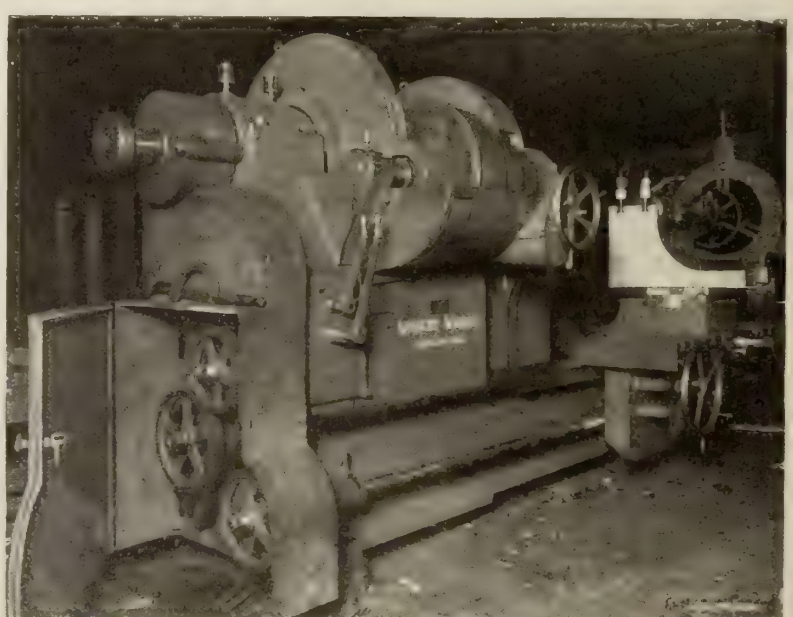
The carriage in the illustrations is equipped with two compound slides, which may be fitted with power angular feed at the request of the purchaser. The carriage bears upon the ways for a length of 90 in. The apron is made of steel gears and is bush throughout.

The lead screw is kept from buckling by means of supports, which are adjustable and placed at about ten feet apart.

The tailstock, like headstock, is of box construction and is moved easily by hand by means of a geared device, which engages the teeth in the rack of the bed. The tailstock spindle is moved by a handwheel, which is placed convenient to the carriage.

A massive steady rest is supplied with each and every machine.

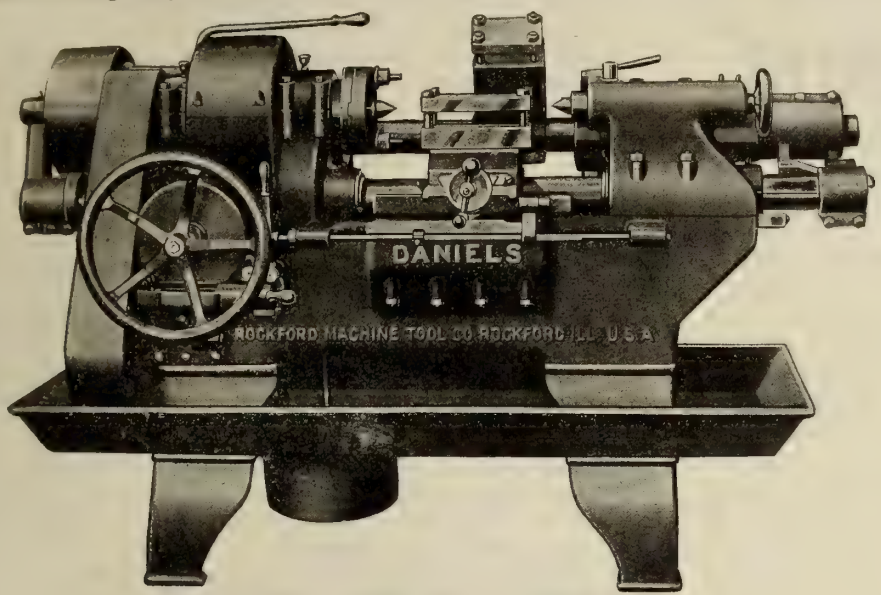
The bed is ribbed throughout with box sections and is fitted with a rack down a centre rib, which engages a pawl on the tailstock, removing the thrust of a cut from the clamps of the tailstock direct to the bed of lathe. The bed provided for the machine in the picture is 48 feet long and will take 34 feet between centres. The total weight of the machine is 150,000 lbs. An idea of the massiveness is furnished by Figure 3, which shows two men sitting on the faceplate.



ANOTHER VIEW OF THE MACHINE.

"DANIELS" AUTOMATIC LATHE

The automatic lathe illustrated, which is intended for the rapid production of duplicate parts in large quantities, is a recent product of the Rockford Machine Tool Co., Rockford, Ill. This machine was designed by Lee G. Daniels, and, while having only a 14-in. swing over the carriage bar, is said to be built on 22-in. heavy-duty lathe lines in order to withstand severe service. After being set up for an operation, the work, either centred or mounted on an arbor, is placed in the machine, the speed clutch thrown in, and the feed worm lifted into position; after which the machine goes through its operations and the tools return to their starting position.



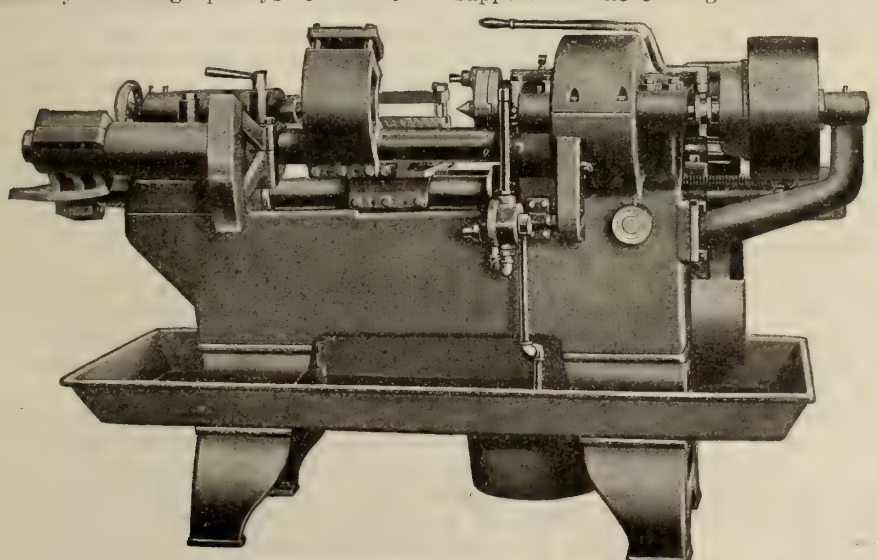
GENERAL APPEARANCE OF MACHINE.

The side and right-angle carriages are arranged to carry multiple tools, the side carriage for turning different diameters and the right-angle carriage for facing and recessing. It is possible to use four or more tools in each carriage, all operating at the same time.

The machine is of the one speed and feed type. If necessary, change gears can be used to vary the feed, but it is necessary to change pulleys to alter the speed. The drive is to a friction pulley and then through a pair of helical gears to the spindle. The headstock is cast integral with the bed. A heavy steel bar bearing directly in the head and tail stocks serves as a support for the side carriage. This is solidly and permanently clamped to the bar. The carriage also bears on a hardened steel way at the front of the bed and when the feeds are tripped the carriage is automatically moved away from the work so that the tools will not drag in returning to the starting position. Special hardened-steel ways can be furnished to give the work taper, convex or concave form if desired.

The right-angle carriage is mounted on a bar supported in bearings in the head and tail stocks, a segment cam on this bar being actuated by a roller from the side carriage bar. The tailstock is of the four bolt type cast in one piece and fitted with a taper gib.

The bars for supporting both carriages are finished by turning and grinding from high-carbon forged-steel bars and are 3½ in. in diameter to insure rigid support for the cutting tools.



VIEW OF MACHINE FROM REAR.

A lubricating system is provided, the oil pump being driven by a chain from the clutch shaft. Flexible tubing for delivering the lubricant to the work is regular equipment.

"W & B" WRENCH BOARD

The Whitman & Barnes Manufacturing Company, St. Catharines, Ont., are putting out an attractive new board for displaying their drop-forged wrenches. The background is light golden oak, the display card is black with gold lettering.

The wrench board is designed to be of greatest assistance to both the dealer and the purchaser. Each wrench number is plainly marked in red. Wrenches may be had either semi-finished or black enameled finish. As the new board is only 8 inches wide by 28½ inches high it may be used to advantage in the window as well as in its more usual location or store column or walls.

The assortment of ten sizes of double head wrenches, three of each size, is not intended to be complete or to take the place of the dealer's regular stock. It does, however, include the most popular sizes for general use, and so serves as a guide to the purchaser as well as a silent but effective salesman and stock-keeper for the dealer.

GENERAL APPEARANCE OF THE BOARD.

A handy little booklet describing the new wrench board will be mailed to dealers on request.

The Good-will of the Men

WHY is it that there are some of the steel mills of United States running 100 per cent. to-day, while others were shut up tight the first day of the strike?

Now there is no chance work about this. Organizers and strike leaders are just as eager to tie up one mill as another, although it is a fact that the strike is aimed primarily against the Steel Corporation.

At Vandergrift, for instance, the strikers made no headway. George McMurtry was at the head of this mill long before it went into the Corporation. He made a study of men. He wanted to make life pleasant for them. His men were greater to him than the steel they were to turn out.

At Middletown, the home of the American Rolling Mills, the influence of such a man as George M. Verity is seen in the present crisis. That mill is running and chances are that it will continue to run. That mill is managed not for the one purpose of turning out a product that is recognized as par excellent, but it is run in such a way that to turn out anything else would cause the men to feel guilty of wounding a friend in his own house.

When is industry going to learn this lesson?

Contented workmen will turn out a good product. Men who are on the "edge" all the time will not.

The successful manufacturer to-day is out to buy more than eight hours of a man's time. If his interest in the human element in his establishment begins and ends as the men pass in and out by the time clock, he is going to get a very perfunctory service. He is not going to have an organization that will stand behind him in spite of all that strike-agitators can do.

Don't say that it cannot be done. Do not take refuge in the experience of someone who has made a half-hearted attempt.

Men are still men. They can be appealed to as such. They can see when a firm comes to them on the "dead level," and they have also learned to look a gift horse in the face.

You cannot run your shop on the card-index plan. A man must be something more than a number on a card or a necessary load on the pay roll.

Do you know your men? Do you know anything of their living conditions? Do you know if they are up against a big load in the way of sickness or hard luck?

You say you have too many to know in this way. Then that is all the more reason to set at this work systematically.

There are Canadian manufacturers who know their men. They can get out in the shop or the mill and call most of them by the first name. Do they lose prestige? Do the men get too familiar? Not much! These men are having a good time every day, and at the same time they are wisely practising a commendable sort of self-preservation.

I Don't Know

THE superintendent of a fairly large shop in a Canadian city went to one of the mechanics not many days ago. He said, "We need a new key-seater in this shop. What make would you advise?"

That mechanic did not have to spend a cent to have all this knowledge at his tongue's end. The firm placed a number of mechanical papers at the disposal of its men. All that was necessary was to apply at the circulating library.

Right then was his chance to have told the superintendent what he thought. He should have been able to tell him what he preferred and why. He knew the class of work done in the shop; knew what was necessary, but—

He said: "I don't know."

And right there he passed up a chance to become an authority on what was good shop equipment.

The superintendent was in quest of information. He was out to find a mechanic who recognized that this is a day of machine production—a day when shops must have the machine suited to their work.

He wanted to know which was THE machine for their plant, and why.

Now it was quite natural that he should go out and ask a mechanic in his own shop. The superintendent may have had something else in his mind, for promotions come at the most unexpected moments.

But that mechanic, at the first test, in the first round, passed along his chances when he said: "I don't know."

This is the day when the man who is going to the top of the heap will be able to say: "We need this make of machine. It will do the work here because—" and then he goes on to tell why.

The advertising and new equipment pages of a paper like CANADIAN MACHINERY are full of the newest developments in the machine tool field. They are an education to the mechanic who is bound on getting into the "I know" class. They are a sealed book to the "I don't know" mechanic.

The "I don't know" list is a long one. It has few men who can reach very far through the cashier's wicket on pay day. The "I don't know" chap has only 44 or 48 hours of his time for sale each week. He has nothing else of value to his firm.

The "I know" man is in demand. He has his skill plus his information on up-to-date equipment and methods.

If you want to enter the field of larger service, get away from the monotony of production—get in the "I know" class. It is entirely a personal matter. No one else can do it for you, and no one can keep you from learning.

Is There To Be No Limit?

THE United Mine Workers of America, at the Cleveland session, state their programme as follows:—

> Sixty per cent. increase in all mine wages.
>
> A limit of six hours upon the day's labor underground.
>
> A five-day week, with time and a half for overtime, and double time for work on Sundays and holidays, and important improvements in conditions of labor.

If these demands are not met the miners will strike on November 1.

The sixty per cent. increase in pay and the decreased hours of labor mean easily a hundred per cent. increase in the price of coal.

Readers may at first be inclined to take these demands with some degree of levity, but there is the utmost seriousness in the presentation of the demands, and in the whole proceedings.

This continent needs coal—needs a lot of it, and needs it right now. The miners propose to stifle production and enormously increase the cost.

They propose to saddle every worker in Canada and United States with a load that he cannot carry and decently exist.

The strike, as a legitimate weapon, is being abused beyond words. There have been times, many of them, when a strike was the only thing to which labor could turn and maintain any reasonable degree of self-respect.

The continued resort to the strike by men who have not a large enough grievance to warrant this extreme measure is making the phrase "they've gone on strike" a word that arouses little sympathy and less support.

President Tom Moore, of the Trades and Labor Council of Canada, at the Hamilton convention, had this to say:—

"A number of leaders of labor and those who follow them have been repeatedly warned of the economic danger of too frequent or too wide a use of the strike weapon. They have been told that it is inimical to production and to the best interests of the nation, and so will ultimately rebound upon themselves. They have not, however, been sufficiently warned of the danger they run of spoiling their final and best weapon of defense by its too great use and by attempts to force by its means decisions that such a weapon ought never to obtain."

The very word "strike" is being stripped of its real meaning, and robbed of its strength in portraying to the mind the idea of a struggle of the weak against the strong.

The wise labor leader cannot afford to take "the public be damned" attitude. The public in the last analysis hold a tremendous amount of power that they have never yet exercised, but it looks as though it might be necessary to organize and harness some of this power for the purpose of protecting the great mass of the community—the common people.

Back to the Stone Age?

HERE is an item from the "society" columns of a Toronto newspaper:—

> "Five hundred dollars was paid for an evening cloak and four hundred for a gown one day this week by a well-known Toronto woman."

The chances are that had the paper inserting this paragraph thought seriously about present-day conditions, about the volcano of unrest on which we are sitting, or of the things men and women are thinking about and saying, the paragraph would never have found its way into print.

There was a time when people took it for granted that it was all right for some people to have all they needed, and more, while others had not enough to keep body and soul together.

During the days of the war much was said of the breaking down of class lines, of the levelling of the people to the plane of service and sacrifice. In fact, were one to have taken seriously all that was said, it would be reasonable to expect that we should now be in an era quite different to that before the war.

But that was a war-time dream. The sacrifice was made, but the selfishness returned. It is here to-day. It crops up all over and will not be downed. The pursuit of dollars is once more the centre and circumference of man's life.

And so we have this vulgar display of wealth again. Oh, yes, it is interesting to read of $900 being paid for a gown and an evening coat! In fact it might be more so were it not a fact that one can see women with market baskets going to butcher shops and stalls looking for cheap cuts of meat, and turning away again with empty baskets because there happened to be no cheap cuts on that day.

This old world is in the melting pot, and the outpouring has not yet come to pass. Nor are we going to have the dross skimmed from the gold by the poor vaporing of the social columns of the daily press, where some censor has the job of selecting the social sheep from the unfortunate herd of goats that have committed the awful crime of not being wealthy.

It is a fact that this old world hungers for love, for the handclasp that has a heart-throb behind it, for genuine worth stripped of its trappings, and for manliness that is saturated with integrity and honor.

All things that make for the bringing to the surface of these attributes are worthy of our greatest encouragement, while everything that, in these times of uncertainty and unrest, tends to build anew class lines, emphasize social distinctions, or place dollars above character is unworthy of a place in the thought and acts of serious-minded men and women.

MARKET DEVELOPMENTS

The Steel Strike Touches Canadian Markets

Firms Using Much Material May Have to Pay Higher Prices—New York Reports That Machine Tools Are on the Level of the War Period and in Some Cases Higher

HOW long can Canadian industry stand the steel strike in United States? That question is concerning a lot of people just now. There are plants that will be touched very quickly, while there are others that will not feel the pinch for weeks yet. On a broad basis, though, it can be accepted as a fact that it is not possible for industry on this side of the line to prosper while the same business across the border is in the throes of a desperate strike.

The strike came at a bad season of the year for Canadian business. Warehouse stocks are very low in many lines. Roughly speaking, plates, tubes and large structurals are the lines that we must import, and there are certain gauges in sheets that are much in demand, with only a limited production capacity in Canada. Buying from warehouses has been very brisk for several weeks, in anticipation of strikes, with the result that these places are pretty well cleaned out.

Prices will be firm and higher on many lines. One user of sheets, for instance, who wanted 20 tons, found that by the time he had made the rounds of several houses to secure his requirements, he had to pay $400 more than he figured on. Although the actual lists may not be altered, the chances are that premiums will be secured on a good many lines where there is any chance of delivery.

It might be supposed, at first glance, that Canadian steel mills would benefit largely from the strike. They may for a short time, but not in the long run. For instance if a factory cannot secure plate, it will be only a matter of time before it will be closed off, and out of the market as a buyer of those lines the Canadian mills are in a position to ship.

TROUBLE IN ENGLAND WILL HURT OCEAN SHIPMENTS FROM CANADA

Special to CANADIAN MACHINERY.

MONTREAL, Que., October 2.—In addition to the uncertainty that has followed the inauguration of the steel strike in the steel districts in the States, the action of the railway men in Britain has added to the unsettled condition in this district. Not that the situation here has been directly affected, but the consequence of these disturbances will eventually be reflected throughout the industrial world. The immediate result of the strike in England will be to create a congestion at ocean terminals that will cause the Government to place a virtual embargo on imports and exports. Already the ports in the Old Country are unable to take care of the material that is accumulating, and restrictions are looked for every day that will curtail the activities until the situation can be relieved. Officials at the port here are looking for some action that will call for revised regulations in regard to shipping to British ports.

Strike Shows Little Effect So Far

Despite the fact that the steel strike in the States is casting a cloud over the activities in this district, the business here has shown no outstanding developments as a result of the unsettled state prevailing in the American steel centres. The conservative attitude that has been only too pronounced during the past few months has become additionally emphasized during the week just passed. The present demands, however, are not of a character that activities would be suspended in consequence of the close-down of the United States mills. It is learned here, that, apart from the heavier classes of materials, such as plates and large shapes, the requirements of the trade can be supplied from the Canadian mills, or stocks that are in the hands of dealers. In some respects the strike has been foreseen, and many consumers have protected themselves by covering their requirements for weeks ahead. This, with the light volume of present business, will assist in tiding over what would otherwise be a serious situation. So far there has been no alarming conditions here as the mills have been able to supply all the needs for immediate demands. Should the strike extend for a long period the effect would be first felt in plates and shapes, and the demands for this material here is very light at present. While it is impossible to predict what will eventually take place, the trade here is quite optimistic, and many believe a settlement will be reached within a very short time. However, should the present trouble spread, the market would undoubtedly strengthen and price quotations would likely advance. Dealers here are holding to current quotations and do not anticipate an advance unless a serious turn develops across the line.

Metal Showing Weakness

The metal situation here has felt the effect of the unsettled condition now prevailing in the States, not in a direct way, but consumers are adopting cautious methods until affairs become more stable. The demand has shown a slight falling off, and as a result dealers are quoting weaker prices on all the metals. Copper is now quoted at 25½ for lake, and 25 cents for electro and castings. Tin is down 1 cent, and the price asked is 59 cents per pound. Spelter is now 9½, this being a decline of ¼ cent on the week. Antimony shows a similar decline and is quoted at 9¾ cents. Aluminum is lower and the quotation of 33 cents represents a decline of 2 cents per pound.

Little Scrap Movement

Dealers here are closely watching the developments across the line, but the effect so far has only been one of passive interest as the market here has not been affected by the tie-up of the producing mills. It is difficult to state what will

Six Post Readers in New Cabinet

FORMER Finance Minister Cashen, who, following the crisis which led to the resignation of Premier Lloyd, of Newfoundland, has been called upon to form a Ministry, has already selected nine members to act with him.

Six of these, including the Premier himself, have been regular readers of THE FINANCIAL POST for some time.

This does not only indicate the quality as well as the extent of our circulation, but indicates also that men who carry big responsibilities find THE POST of value to them. It indicates, therefore, the approval which is meeting the effort of our editors and the great importance and value of the business information to which subscribers have access through the columns of THE FINANCIAL POST.

When the Government of Newfoundland was recently arranging the flotation of a $5,000,000 bond issue THE POST'S opinion as regards some methods of marketing was quoted by members of the Cabinet.

The Financial Post at Ottawa

IN the Dominion House of Commons the other week the attention of the Government was drawn to an article in THE FINANCIAL POST containing a reference to the financing of Roumanian orders through an agency established in London by Sir Clifford Sifton. Sir Thomas White mentioned that in reading his FINANCIAL POST that week, he had formed the opinion that the reference was to private marketing of bonds.

Keen Business Men and Cabinet Ministers Read the Post

SIR THOMAS WHITE, with other Cabinet Ministers and prominent Canadian men of affairs, have found THE FINANCIAL POST of swift and sure business service. When you "get down to business" you want the plain facts—all of them—without frills—and quickly. You get them like that in THE POST. THE FINANCIAL POST will keep you informed on Canadian business matters in a way unrivalled by any other publication. Send for a subscription to-day. The price is $3.00 per year, and you have only to fill in this form:

The MacLean Publishing Co.,
143-153 University Ave., Toronto.

Send me THE FINANCIAL POST every week till further ordered. I will pay subscription price, $3.00 per year, on receipt of bill, or you may draw on me for this.

take place should the strike continue for any length of time, and it is hard to get any dealer to commit himself in this connection. The feeling is general that the strike will be of short duration, and for this reason the dealers are reluctant to speculate on the market. They are willing to let present prices stand for another week.

MUCH INTERESTED IN STEEL STRIKE

Canadian Firms In Some Lines Must Secure Their Supplies From U. S. Mills

TORONTO,—The strike in the steel mills of the U. S. is the big cloud on the horizon this week. Warehousemen want to know how they are going to make out. Firms that have orders in the U. S. mills at the present time want to know what chances they have of getting deliveries from them, and the firm that wants plate rolled to keep the shops going are keen for any intimation of how serious will be the curtailment of output at the mills.

So far the strike has not hurt this country. But it would be folly to say that Canada is going to be free for any length of time. Indications point clearly to the fact that if the trouble continues, this country is going to be seriously affected.

How It Works Out

The Canadian steel mills should get a larger tonnage of material than they are capable of handling. If they are in shape to handle much more is not certain. For instance, one firm—an American concern that is putting a branch in Canada in the Windsor district—was going to buy 50 tons of sheets. The order in the natural course of events was going to be placed at the U.S. mill where the parent concern had been securing material for some years past, and in the use of which they were accustomed. There is some urgency in the order, and it will go to a Canadian mill. There is no reason to suppose that this one case will not be duplicated many times.

How the Stocks Stand

Warehouses report that their regular supply of plates has been largely shut off, although there are some deliveries coming through yet. That is to be expected as there would be a large amount of material practically ready for shipment, and some of it actually on the way when the strike started, and of course, there are mills that are making shipments even yet.

There is very little plate in the warehouses of this country, and the fact that there has not been very heavy buying is responsible for this. Jobbers preferred to do an import business and pass on orders for mill shipment rather than stock heavily in a rather uncertain market. During the past few weeks when it seemed probable that there would be trouble in getting material from the United States mills, there has been a run on the warehouses carrying wanted sizes and gauges, and so it is that plate stocks in the warehouses are low—very low in fact, with very little prospect of getting them replenished for the present.

It would not be surprising were prices to stiffen at once. For some time past there has been more or less juggling with the prices of plate, which has been the weak spot in the whole steel list. Business, while nominally at 2.65, has in many cases been going across at 2.50. The strike situation will no doubt take care of this tendency, although the selling agencies of the mills state that they do not intend to enhance prices on the strength of the strike.

The Case of Sheets

The case of sheets is different, as this is an article that has some capacity in this country. There is no guess-work in sheets, though, because they are going to go up. In fact, they have already gone up. Just who to blame for this order of things is hard to state. It is a question much the same as who is the greatest offender, the man who takes or gives a bribe. Very often the purchaser, finding that his plant is very much in need of a certain line, will pay a premium for delivery, in which case the seller is relieved of the embarrassment of approaching this rather delicate question.

But here is a case in point. One Ontario firm wanted 20 tons of sheets, and they were very anxious to get them. That twenty tons is costing the buyer, by the time that several warehouses have contributed their quota, something like $400 more than the former price which was good up to a few days ago.

There are not many galvanized sheets in several of the warehouses, and prices vary a little on these, while the chances seem to be that, with black sheets, their raw material, going to a higher level, the galvanized product will move in the same direction. Sheet stocks are very low at the moment. This is due to the fact that there has been such a rush for sheets in the last couple of weeks that the warehouses have been brought down to very little to choose from. Many of the orders coming in are for No. 10 gauge, and for this there is little capacity in Canada, one mill in Nova Scotia alone being able to do this up to a limited sized strip. This is in reality a thin plate, and is used largely for smoke stacks, tanks, etc.

Tubes Not Plentiful

The strike has found the stock of tubes in Canadian shops and warehouses "shockingly low" as one of the sales managers put the case to CANADIAN MACHINERY this week. They are low in sizes and qualities, because there has been a very heavy demand. In this case there is no reason to doubt what prices are going to do. Already there has been a ten per cent. increase announced by the larger warehouses on the other side of the line. Two, three and four-inch tubes are wanted in this country, but they are not to be had with any degree of certainty or freedom in regard to the quantity ordered.

It looks as though the strike had come at a bad time for the Canadian warehouse trade. CANADIAN MACHINERY knows that there are large orders across the line, as warehouses had decided in several cases to stock up ready for whatever uncertainty might come in the winter months from transportation problems. Deliveries are not coming through against these orders, and as a result, they have little to offer their customers.

Doing a Good Business

Dealers in machine tool supplies report that they are doing a lot of business, and that it is well distributed, taking in a large number of industries.

And while speaking of small tools, such as certain makes of drills, one Toronto dealer remarked to CANADIAN MACHINERY this week: "This is a line that no person seems to be making money out of. I know for a fact that the man who sells them is now doing little more than breaking even in many cases, while it hardly seems likely that the makers are showing a decent profit. There has been too much competition and cutting to meet local and special conditions. I wish the makers would have some understanding, for as matters stand at present there are cases where the customer is actually in a position

POINTS IN WEEK'S MARKETING NOTES

New York reports that there have been several increases announced in the price of standard tools, and that in many cases the prices are now even above those that prevailed during the war period.

—

Canadian manufacturers using much material that is imported from U. S. steel mills report that in most cases they have enough stock on hand to last them for some weeks to come. They admit that if the strike is continued for any great length of time, however, matters will be serious for them.

—

Pittsburgh reports speak hopefully of the strike in the steel mills falling through.

—

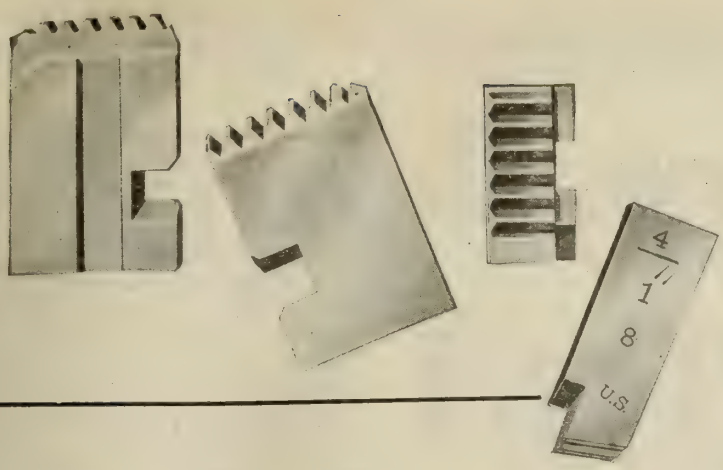
The steel strike is having its effect already on Canadian materials. Increased prices are reported on sheets, and buyers are in some cases willing to pay premiums for delivery.

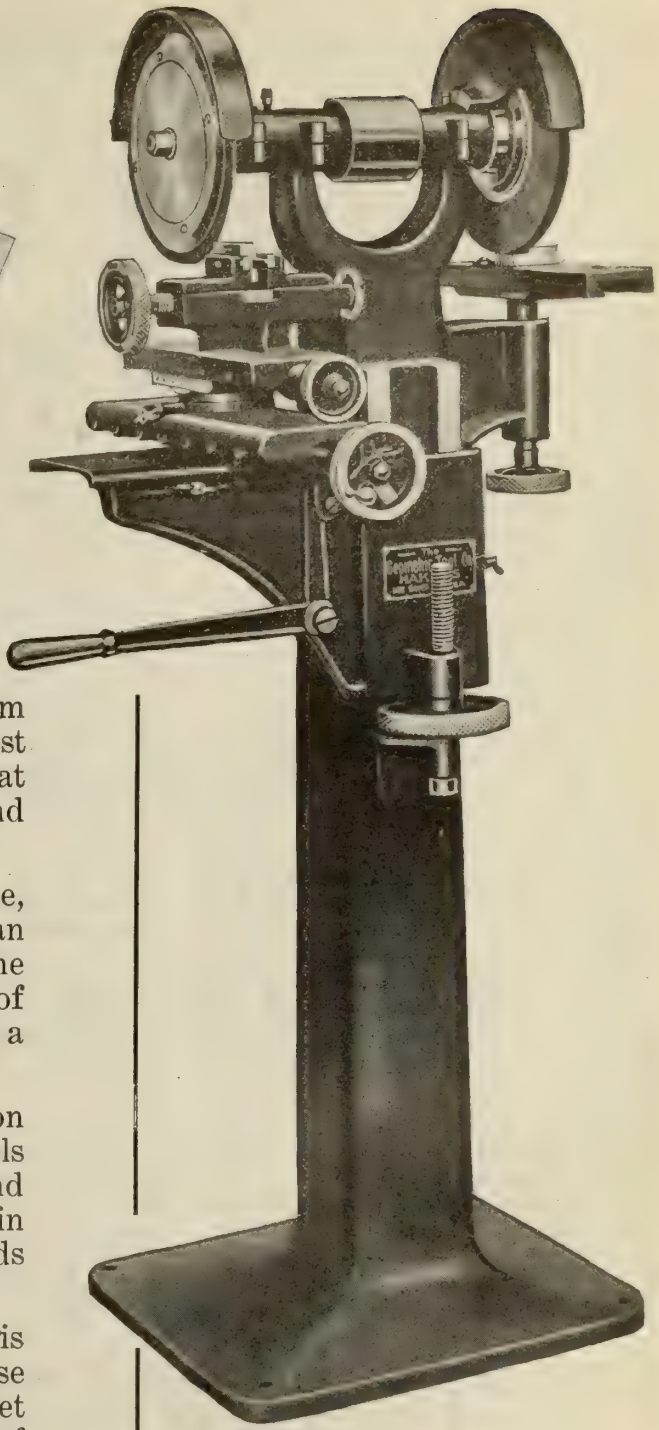
—

A new list is out on steel tubes, showing increases. The stock of tubes in Canada is particularly low at present, especially in two, three and four inch sizes.

—

Montreal fears that the strike in England will bring out embargoes which will tie up ocean shipping.





Sharp Chasers Cut Clean Threads

Accurate, uniform threads result only from dies which are maintained in the highest state of cutting efficiency. This means that chasers must be kept sharp, and ground uniformly.

Even if just touched up from time to time, the chasers respond splendidly, with clean threads. And with this machine — the Geometric Chaser Grinder—the matter of keeping threading tools up to scratch is a comparatively simple matter.

Various makes of chasers can be ground on this adaptable machine. The two wheels permit the easy grinding of both milled and tapped chasers. In addition, the plain wheel lends itself readily to various kinds of tool grinding.

Uniform grinding of a set of chasers is purely a mechanical matter through the use of adjustments which can be accurately set to govern the grinding of an entire set of chasers.

The Catalogue describing this machine is a mine of information on chaser grinding. Write for it

to name the price which he is going to give you his business."

It would not be surprising were something done along these lines, not with the idea of creating a combine to boost prices, but simply to put the whole business on a fair basis where all would be treated alike.

NEW YORK REPORTS SOME TOOLS EVEN HIGHER THAN IN WAR TIMES

Special to CANADIAN MACHINERY.

NEW YORK, October 2.—The effect of the strike in the steel industry upon machine tool trade has been to reduce the number of inquiries. On the other hand, a very fair amount of business, most of which has been pending for weeks, has been closed within the past week. The falling off in inquiries indicates that manufacturers in metal working lines will not make new plans until the outcome of the steel strike is definitely determined. A victory for the unions would be a severe blow to American industry, and, while no such result is expected, there is a degree of uncertainty in the outlook that will hold up business. What the steel companies now fear is that President Wilson may attempt to take a hand in the situation and suggest an arbitration commission. The steel manufacturers have nothing to arbitrate. The issue in this strike is clear-cut—it is a fight on behalf of right-thinking Americans against the despotism of labor leaders who are un-American in their ideals and aspirations.

The thorough publicity given to the revolutionary character of W. Z. Foster, secretary of the strike committee, and the statements of John Fitzpatrick, chairman, to a Senate committee that labor is aiming at the socialization of all basic industries, has focussed public attention upon the crisis in Governmental affairs that might come through a victory for the unions in the steel strike.

Among domestic buyers of tools in the past week may be mentioned the Dusenberg Motors Corporation, Elizabeth, N.J., now a part of the Willys Corporation; the Hendee Manufacturing Co., Springfield, Mass., manufacturers of motor cycles; the De Laval Separator Co., Poughkeepsie, N.Y.; the Sharples Separator Co., West Chester, Pa.; the Crown Cork and Seal Co., Baltimore, Md.; the E. W. Bliss Co., Brooklyn, and the Bessemer Gas Engine Co., Grove City, Pa.

In the export field there is considerable inquiry but not much buying. The J. G. White Engineering Corporation, New York, is placing orders against a $250,000 list for Switzerland. An export company is asking for quotations on about 100 or more tools for locomotive and car repair shops in South America, and a South American mining company, with offices in New York, has issued a list of about fifty tools.

Manufacturers of planers have advanced prices from 15 to 20 per cent. Practically all types of machine tools are now back at war-time prices, while a few are even higher.

Crane business is fairly good, and prices show a tendency to advance in view of the difficulties in getting steel that may result from the steel strike. The Phelps-Dodge Corporation, New York, is inquiring for twelve cranes; the Kennedy-Van Soun Manufacturing and Engineering Co., New York, asks for quotations on seven, and the Cerro de Pasco Mining Co., New York, is in the market for five. An export company, the Transcontinental Merchants, Inc., New York, asks bids on 50 triplex chain hoists for shipment to Japan. The Standard Oil Co., of New Jersey, has bought twenty-eight jib cranes for its plant at Rahway, N.J.

STEEL STRIKE NOT AS SERIOUS A MATTER AS AT FIRST ANTICIPATED

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., October 2.—The steel strike started out as a serious matter, but not altogether as serious as expected. For four days, or until Friday morning, September 26, the matter hung in the balance, whether the strike would spread or would recede. The information gathered together Friday morning showed positively that the strike was losing ground, proving conclusively that, barring accidents, it would be lost, and probably in a few weeks.

The character of the strike was determined the first day. The organization campaign, authorized at the annual convention of the American Federation of Labor at St. Paul, June, 1918, was under the auspices of 24 unions affiliated with the federation, these unions being of various crafts which had more or less employment in the iron and steel industry as a whole, but did not represent any large proportion of the men employed. Machinists, engineers, moulders, etc., are employed to an extent and their joining the unions and going on strike would cripple operations more or less. The organization campaign also took in common labor.

When the strike started it was at once disclosed that it was not primarily a strike of these skilled men at all, but of the common labor, and chiefly the foreign born labor at that. The latter struck practically 100 per cent., while of the American born common labor many were willing to work. Then two things occurred, making the influence of the strike more serious. Men who wanted to work were thrown out of employment because other men, needed for operating a plant or a department as a whole, were on strike, and men who were at work were intimidated by strikers and gotten out. For illustration, practically all of Youngstown was on strike by the end of the second day, but the Trumbull Steel Company, operating a steel mill and sheet and tin plate mill at Warren, a few miles distant, was in full operation. Strikers marched up the Mahoning valley to Warren and "got" the mill at the time of changing turns, the fresh turn not being allowed to go to work. The same thing occurred at Canton, the men from a striking plant marching to the Canton Sheet Steel Company plant, which was not on strike, and closing the mill.

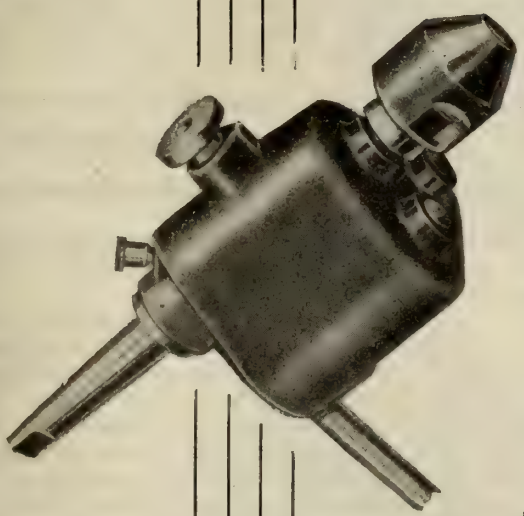
By Tuesday night a low point in operations was reached. When the strike started, at 6 a.m. Monday, September 22, about 35 per cent. of the productive capacity of the iron and steel industry was thrown idle. Then a process began of the strike losing at places where it had started poorly, and of spreading where it had started well. By Tuesday night the idleness amounted to about 40 per cent. Then began a close watch of how things broke from hour to hour. As the Youngstown and Wheeling districts were down tight and the Monongahela Valley was working moderately well, while the rest of the Pittsburgh district was nearly normal, it was evident that if the Monongahela valley could continue operating the fact would break the strike in Youngstown and even Chicago and Gary, which were about two-thirds down, would eventually

GET ON THE JOB

"Don't be an alibi artist. Get on the job," is the legend that is emblazoned on a signboard at the entrance to one of the big steel mills near Pittsburgh; and there are authentic reports to show that the honest-to-goodness American is getting on the job. "It is a case of America for the Americans with those fellows," said a steel man to CANADIAN MACHINERY. "What the majority of them cannot swallow is anything in the shape of dictation from so-called foreign agitators as to what they shall do. That has been a big factor in the present strike. The real American is from Missouri. Moreover, a good many workmen who own stock in steel concerns are getting a glimpse of the other fellow's side of the question. They realize that unreasonable labor unrest and agitation endanger their investment."

Taps Ten Times FASTER

Make your drill press do your tapping ten times faster than is possible by hand, by equipping it with



Aikenhead's

WALSTROM ATTACHMENT

The mechanically obtained OSCILLATING MOVEMENT closely resembles the action in hand tapping and cuts tap breakage to a minimum.

10 Days' Free Trial

For the benefit of shops that are unfamiliar with the great advantages of the Walstrom Attachment, we will ship one to any responsible firm on 10 days' free trial.

Should you at the end of this period not find it an invaluable asset to quick and economical production, return it and we'll promptly refund your money without question.

17 TEMPERANCE STREET, TORONTO

If interested tear out this page and place with letters to be answered.

feel the influence. Accordingly, the close watch was kept on the Monongahela valley. As it was chiefly a strike of common labor the blast furnaces were most affected, and the blast furnaces were also more vulnerable because the men have to work in the open. After Tuesday night the number of blast furnaces began to gain, but as there were losses elsewhere it was not a clear case, Chicago and Gary going down more and more, while the strike in Cleveland became practically complete. By Friday morning, however, as noted above, there was good news only and the swing was towards the strike waning. An important influence outside the Monongahela valley was that Tuesday and Wednesday there was a cleaning out of Bolshevists at Sharon, in the Shenango valley, 70 miles north of Pittsburgh. Nearly a hundred were gathered in. Then the intimidation that had gotten out many men in the valley in addition to those who had struck, ceased, and beginning with the resumption of one Shenango merchant stack at Sharpsville Thursday night, operations in the valley increased, although very slowly. This is counted upon to have a favorable effect upon Youngstown and the rest of the Mahoning valley, just over the state line in Ohio, where everything is still closed.

It is largely a matter of protection by the civil authorities. In Pennsylvania nearly all the county and municipal authorities have done well to preserve order, and the magnificent Pennsylvania State Constabulary, a perfectly trained body of mounted men, has worked wonders. Two of these men can take care of a moderate sized riot. In Ohio there is no state constabulary.

The issue of a strike is usually settled the first week, though the strike itself may last much longer. With the start this strike made, it could have no hope of success unless it continued to gain throughout the first week, but it gained only during the first two days. Wednesday it was suffering more losses than gains, and since Wednesday it has had losses only, and no gains. Barring accidents, it is lost to the agitators and won by the manufacturers, and not by the latter doing anything except endeavoring to keep the agitators from doing mischief.

Winning a strike and producing steel, however, are different things for the manufacturers. The test, in this instance, has not been the amount of steel produced, but the number of men willing to work. Men have been kept in employment at works when the efficiency of the plant was more or less diminished by departments not being uniformly manned, and production has not been in the same proportion as employment. Thus, if as estimated there was 40 per cent. idleness when the strike was two days old, that does not mean that actual tonnage production was 60 per cent. of normal.

Furthermore, assuming that there are no accidents or unexpected developments and the manufacturers have virtually won the strike, it does not mean that production will be fully restored in the near future. The strikers in some districts may hold out for weeks, perhaps many weeks, depending in considerable part how well order is preserved, for twenty per cent. of the men can often intimidate eighty per cent. of the men and keep them from working. At the best there will be a large loss of production and consumers of steel will be incommoded very considerably. There are stocks in buyers' hands, but the stocks are not large and are probably somewhat below normal. Buyers of steel products have displayed a fine feeling of sympathy for the steel producers and are indisposed to bother them about deliveries.

Of course, it is impossible to be absolutely precise as to the extent various producers are affected by the strike, but the following is a summary that cannot be far from the exact fact, dealing with conditions as they were at the end of last week: East of Johnstown, Pa., and Buffalo, N.Y., practically everything working. Cambria at Johnstown, closed tight, also Lackawanna at Buffalo and some of the merchant furnaces at Buffalo. Cleveland, down tight; Lorain, nearby, running full. In the Pittsburgh district, Jones & Laughlin Steel Company operating both South Side and Woodlawn works practically full, the remainder of municipal Pittsburgh operating above 50 per cent. Monongahela valley, the largest single section of the Pittsburgh district, lower part including Homestead, Duquesne and Edgar Thomson works of Carnegie running nearly full; middle part of McKeesport, almost full; Monessen, at upper end, both steel plants closed. New Castle, at foot of Shenango valley, operating almost full; Farrell and Sharon, near middle, operating little, but increasing; upper part, almost idle, but gaining. Mahoning valley, including Youngstown, down tight. Wheeling district, down tight, except a few mills running practically full. Calumet district (Chicago and Gary) almost down. The south running almost normal.

PIG IRON TRADE

The demand for pig iron thrives. Fear that deliveries may be away off on account of the strike is responsible for this.

Philadelphia.—Inquiries are coming for big tonnages. Some are from three to five thousand tons. In one other case the American Bridge Co. is reported to have asked prices and delivery on 25,000 tons.

Boston.—In the past week Boston dealers placed a tonnage of at least 14,000 for 1920 delivery. Largest buyers are makers of textile machinery.

New York.—It is hard to secure "right now" shipments of pig iron, and for this reason several big orders are now held up. Export business is poor, owing to exchange and shipping conditions.

Pittsburgh.—Prices of all grades of iron are more or less nominal at the moment, because there are no large sales going through to actually determine the values. Several merchant furnaces have been banked, due to the strike.

Buffalo.—Caution is the word in furnace circles here. Bookings for 1920 business are being discouraged.

Chicago.—Deliveries of iron are poor and a brisk demand exists for spot iron. Sellers having iron in transit have no trouble in cleaning out their stock.

New York.—The British Ministry of Shipping has handed over the former Hamburg American liner "Imperator" to the Cunard Steamship Company. The company have dry-docked the vessel and will refit her for their passenger trade between New York, Cherbourg and Southampton.

U.S. SCRAP METAL

Scrap metal trade is much curtailed. Strike conditions are causing a holding-up of shipments.

Chicago.—Buying and shipping of iron and steel is almost at a standstill, owing to the strike. Dealers have been told to stop shipments in many cases. Many grades are 50 cents weaker.

Boston.—For the first time in months heavy melting is accumulating at some plants. Steel rails are $1 down. The ordnance department are offering scrap steel.

New York.—Buying is pretty much on a hand to mouth basis, pending the outcome of the strike. The prices remain nominally the same.

Philadelphia.—The strike has killed the market. Mills will not buy, as they fear that deliveries cannot be made to their mills, and dealers do not want to take the chance either.

Pittsburgh.—The halt has been put to business here. Prices are only nominal, and some of the mills are asking suspension of contract shipments.

Look for Settlement.—One hundred moulders, employees of the Canadian Ingersoll-Rand Co., The Sherbrooke Iron Works, the E. & T. Fairbanks Co., and other plants walked out, demanding a $5 per day wage and other conditions. Some weeks ago the moulders made certain demands, chief among which was a nine-hour day with the same pay which they had been receiving for ten hours. This was granted by the employers, and the men went back to work. After this a meeting of the union was held and a strike vote taken. The officials of the companies stated that the walk-out would not tie up the production of the factories, and that they hoped for an early settlement.

The Value of the Business Press to Business Men

"Business men do not realize the value which trade journals and technical magazines may have for them in increasing the efficiency of their factories and in giving them a broad and comprehensive view of their business.

"Our foreign competitors read almost every article published upon their business with great care and thoroughness. Many of them have duplicate copies of their favorite trade paper sent to their homes so that they may read them away from the business without being disturbed. Many foreign manufacturers contribute articles to these journals on phases of the business with which they are most familiar. Such articles are bound to be helpful and have a constructive effect.

"Our trade journals and technical papers are the best in the world, and they should be supported and encouraged by our business men.

"Copies should be placed where employees can see them and they should be urged to read and study them.

"These papers are preaching the gospel of sound business on practical lines and are helpful not only to business but to the country as a whole.

"If the suggestions made by them in the past had been followed by our business men it would not be necessary at this time to point out some of the fundamental weaknesses in American business."

—Edward N. Hurley, formerly Chairman of the Federal Trade Commission, in "The Awakening of Business."

WELLAND SECTION

Small Town Advertised and Became a City

MANY cities in Canada can point with pride to phenomenal industrial growth. Once having started to expand, their development has continued, and assessment figures show constant annual increases, not only in property values, but in population as well. One of the most outstanding examples of the effects brought about by well-directed effort to secure industries, and through their agency, build up a strong industrial community, is demonstrated in the new city of Welland. This is the "baby city" of Ontario, and can well be termed the lustiest of all the youngsters of the municipalities. Welland was incorporated as a city on July 1, 1917, and is making prodigious strides to double the population for the next census. Geographically, Welland is particularly favored, and its unusual advantages, the greatest of which is cheap Hydro-Electric power, place this city in a class by itself. In addition to cheap power Welland possesses exceptional rail and water facilities, a combination that has helped materially in securing the large manufacturing plants for the city.

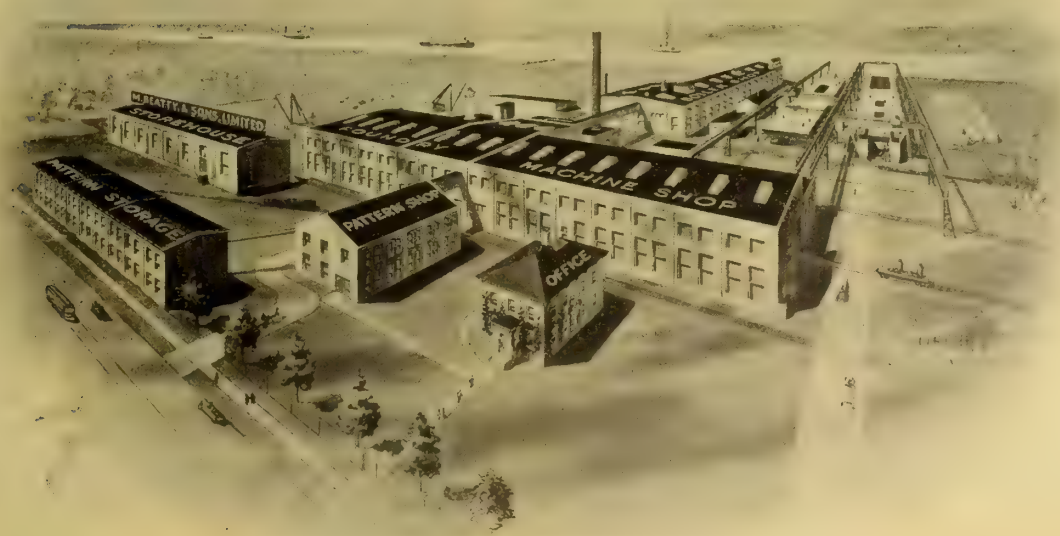
Welland Enters Upon New Era

Welland's present importance as an industrial centre dates from 1906. This was the year of the coming of Hydro-Electric power. First came the Cataract Power Co. of DeCew Falls, to be followed later by the Ontario Power Co., and the Hydro-Electric Power Commission of Ontario. An American, B. J. McCormick, saw the wonderful possibilities that would follow the harnessing of Niagara power, and decided to devote his efforts to promote its interests in Welland. He became the first industrial commissioner, and to his energy and foresight must be credited the location of many of the largest factories in and around the city. In 1915 he was succeeded as industrial commissioner by Louis Blake Duff, who looked after Welland's interests in this respect until 1918, and was followed by W. M. German, who holds this position to-day.

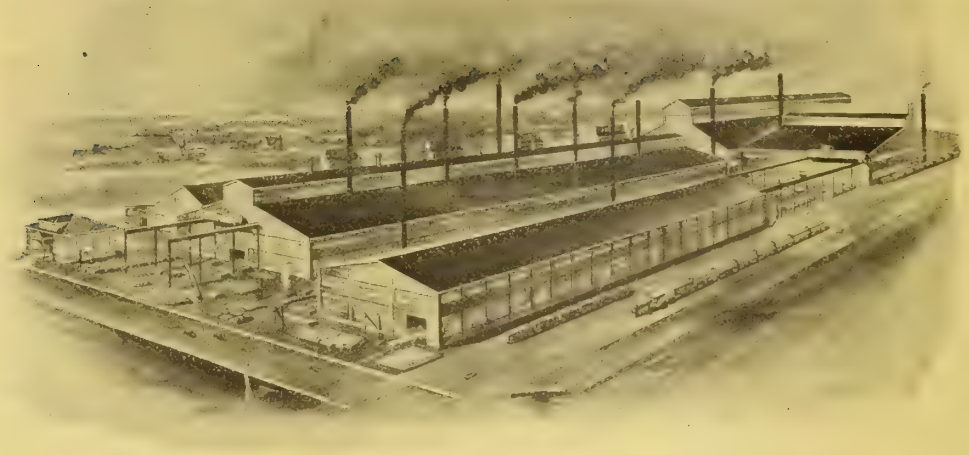
From 1907 to 1917 Welland continued to grow. Its population ten years ago was only about 2,000. To-day it contains 8,825 people, its increase running about ten per cent. per annum. In 1906 the assessment was slightly less than a million dollars. In 1917 it amounted to $6,758,920. The industrial expansion has been equally striking. In 1906 the small sum of $150,000 would have covered the total value of Welland's manufactured products, and ten years later, in 1916, they had expanded to $19,375,115, and of this total only $5,500,000 represented munitions. The industrial payroll was but $50,000 for the entire year of 1906, and in 1916 it amounted to $3,610,336. The number of workers had increased from 100 to 5,000 in these ten years.

Railway Facilities

The railway facilities of Welland are equalled by very few places in Canada. Lines radiate from it in all directions. The Grand Trunk railway from Bridgeburg to Detroit, over which pass, in addition, the trains of the Wabash railroad, the Michigan Central's line from Buffalo to Detroit, also used by the Pere Marquette; the Toronto, Hamilton and Buffalo railroad, direct from Welland to Hamilton and Toronto; and the Grand Trunk Railway's line from Port Colborne to St. Catharines, all pass through or close to the city. The Canadian Northern system also has access through the Niagara, St. Catharines and Toronto Railway, an electric line, paralleling the Welland Canal. The fact that there are so many lines competing for business renders the freight service particularly efficient.



PLANT OF M. BEATTY & SONS, LIMITED, WELLAND.



BILLINGS & SPENCER PLANT OF CANADA FOUNDRIES & FORGINGS

The Welland Canal

The presence of this waterway gives Welland manufacturers the advantage of lake and rail rates. The present canal, though large enough when it was constructed, to admit of the passage of the biggest ships trading on the lakes, has long since become too small to accommodate the long upper lake freighters. To provide for their movement from Lake Erie to Lake Ontario, the new ship canal, now under construction, was designed. This new canal will have locks 800 feet long, 80 feet wide, and 30 feet water depth. There will be seven of these locks, all of the same dimensions.

A Few of Welland's Industries

One of Welland's earliest industries is the plant of M. Beatty & Sons, which was established in 1850, and has since carried on business continuously. The principal output of the company is made up of dredges of the dipper, hydraulic and clamshell types, hoisting engines of all sorts and sizes, both steam and electrically driven, mine hoists, travelling derricks, etc. The firm has built many large dredges, and these dredges can be seen on work throughout the Dominion. At the moment seven large "Beatty" dipped dredges, one hydraulic dredge, several drill boats, and numerous steel scows are in operation on the various sections of the ship canal construction. During the war M. Beatty & Sons concentrated on shrapnel shells, being one of the first firms to undertake this work in Canada. They also made high explosives. After the need of munitions had passed the crucial point, the manufacture of auxiliary ship machinery was taken up, and this company filled large orders for windlasses, cargo winches, ash hoists and similar equipment for the Imperial Munitions Board, the Emergency Fleet Corporation, and other interests.

The Canadian Billings & Spencer Plant of the Canadian Foundries & Forgings, Ltd., was engaged extensively on munitions during the war. This company is now just as busy turning out forged tools, the well-known "Endurance" brand being made at the Welland factory. All the operations in the manufacture of their product are accomplished in this factory, from the making of the original castings to the finished article.

The Electric Steel & Metals Co., Ltd., was formed in 1913 for the manufacture of steel castings by the electric method. This company employed 278 hands on munitions during the war, and is now producing high-grade steel castings of every description for bridge, dock and harbor construction. They have gone in extensively for welfare work on behalf of their employees, and provide many facilities for their comfort.

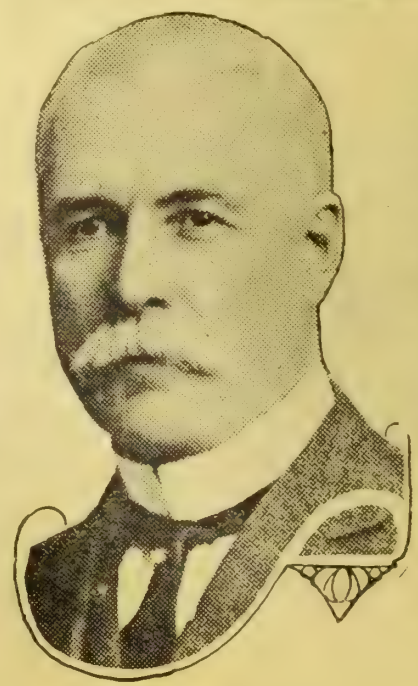
One of the newest industries is the Empire Cotton Mills, Ltd. They manufacture seamless bags, ducks, bag cloths, gray cotton fabrics and twine.

The metals - Chemical, Ltd., are engaged in the making of chemicals, and the Union Carbide Co. of Canada, have a large plant making acetylene and calcium carbide. The H. S. Peters Co., Ltd., are manufacturers of overalls and canned goods are put up by John Goodwillie & Sons. Chipman-Holton Knitting Co of Hamilton have a branch located in Welland, which produces hosiery. One of the plants of the Page-Hersey Iron & Lead Co., Ltd., is located here, which makes wrought, black and galvanized pipe.

At the Electro-Metals, Ltd., ferro-silicon and electrodes and manufactured, while at the Volta Mfg. Co., the product is electric regulators, winches and magnetic brakes.

A complete list of the things made in Welland factories is quite large, and includes such imported articles as automobiles, agricultural machinery, brick, binder twine, boilers, coal stoves, cotton goods, canned fruit, cement blocks, contractors' machinery, dredges, derricks, electric trucks, engines, furnaces, gas ranges, hosiery, hoists, knitted goods, launches, overalls, rope, saws, sash and doors, scows, twine, underwear, etc.

The coming of factories has meant much more than a growth of urban population, with all its attendant advantages in the way of increased business for merchants and more work for builders and laborers. Its effect is noticed throughout the entire County of Welland. The roads have been improved and motorists find little to be desired. The city market is now large and active.



W. M. GERMAN, K.C.,
Industrial Commissioner.

Much of the credit for Welland's industrial growth and prosperity can be traced to its publicity campaigns and it can be held up as an example to other communities to show what energy and up-to-date advertising can accomplish.

At this writing everything points to further expansion in the near future, as Welland is to get the first 100,000 h.p. from the Chippewa Development, and plans are now being made to inaugurate a big industrial campaign.

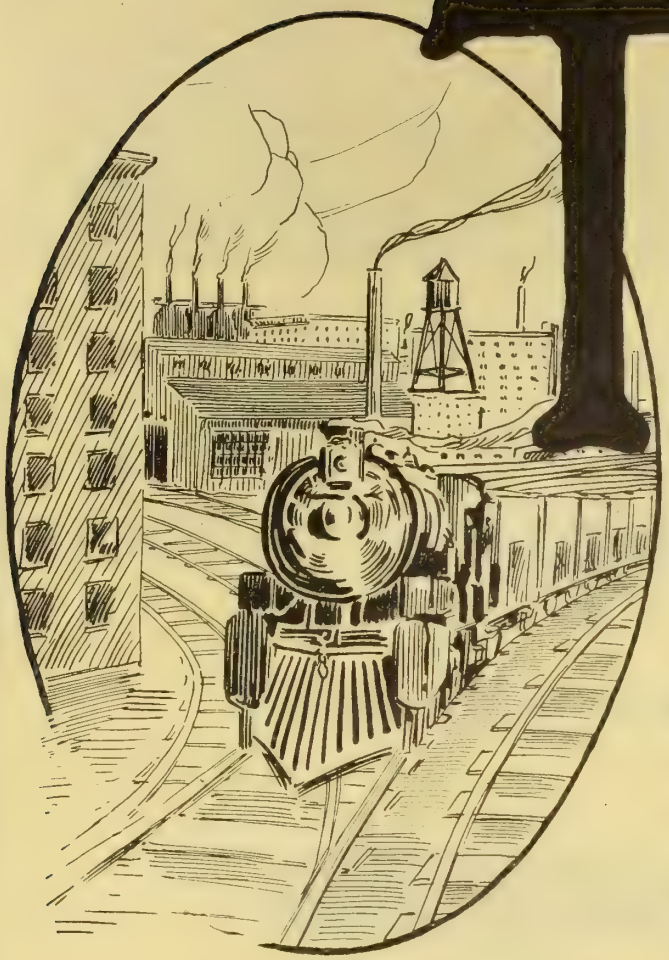
WELLAND, CANADA



The City

Railway and Wa
UNEQU

LAKE SHIPPING : Welland is situated on the Welland Canal, the great marine highway, between tide water and the Canadian North-West, with daily freight service both ways.

RAILROAD RATES : Rates from Welland to the North-West and Pacific Coast, all rail, are the same as from all other manufacturing points in Eastern Canada lying between the Detroit River and Montreal. These rates are fixed by the Board of Railway Commissioners for Canada.

On account of the close proximity to the border, Welland is in the Buffalo switching group, and takes the Buffalo rates from the east and south, and enjoys quick delivery on all raw material imported from the United States.

The fact that all of these roads centre here creates competition, and is the biggest lever the manufacturers have for securing efficient service from the railroads. The seven railroads are as follows : Grand Trunk, Michigan Central, Toronto, Hamilton and Buffalo, Canadian Northern, Pere Marquette, Canadian Pacific, Wabash.

ter Transportation ALLED

Electric Power at lowest cost

Every factory in Welland is driven by electric power supplied by the Ontario Power Company, of Niagara Falls, which is about twelve miles east of Welland, or from the Dominion Power Company of DeCew Falls, which is about twelve miles north of Welland. The fact that we have competitive companies operating in this district gives us competitive prices on power.

Excellent factory sites at low prices.

Labor conditions are eminently satisfactory.

Liberal advantages and concessions granted by City Council.

Prompt and Full Replies will be made to all inquiries.

May we send Book of Information telling all about Welland?

MALLEABLE AND CAST IRON PIPE FITTINGS

The Brand That Has The Quality

"Quality" and "Reliability" are two essentials demanded of *Cast Iron* and *Malleable Fittings*, by all sanitary and heating engineers.

Time and money are lost by improperly made fittings. All our cast iron and malleable fittings are properly recessed and every fitting bears the above trade-mark of quality.

We make a complete and full line of both flanged and threaded fittings from ⅛-inch up, and can make deliveries from stock, both standard and extra heavy.

When ordering from your jobber be sure you buy---"the brand that has the quality." They are different. A trial order will convince.

Canadian Trade and United States Steel Strike

HOW will the steel strike hit Canadian firms? It may be a little early yet to secure an intelligent answer to such a question. Some firms can go along indefinitely. Others can not. In some cases the effect will be felt very shortly.

Goold, Shapley & Muir, Brantford, make gas engines, tractors, windmills, tanks and towers, etc. They state:

"In our opinion, if the strike amongst the steel workers in the United States is at all prolonged, it will have a most serious effect upon industries using this class of material in Canada, as it will undoubtedly force many industries to shut down until supplies can be secured.

Unfortunately our Canadian steel industries are not yet sufficiently developed to secure all the product necessary in our own country, and in any case they would be so severely taxed that it would not be possible to supply the demand.

We sincerely hope that this matter may be adjusted at a very early date, as we look forward to serious consequences to the workers of Canada if Canadian manufacturers are compelled to close their works through a lack of supply of necessary material."

C. H. Waterous, of the Waterous Engine Works Co., Brantford: No doubt if the steel strike conditions for any length of time, and the production of steel is thereby decreased (which probably will be the case), it will have the effect of reducing the quantity of this material, and this will have a bad effect on Canadian business. Quite a number of sources of supply that were available before the war started are not now in a position to furnish material, which adds to the possibility of shortage."

Alex. R. Goldie, of the Goldie & McCulloch Co., Limited, Galt: "It is, of course, impossible as yet to foretell the result of this strike, as I do not know what stocks the steel companies in the States have been carrying, but, undoubtedly, if the strike continues for any length of time it will very seriously interfere with our business as a great part of the steel that we get from the United States cannot at present be obtained elsewhere. We have at present a good stock of steel material, so that we are not interfered with as yet, but certainly will be if the strike continues."

One of the largest makers of machine tools in the Dominion says: "We would advise that our purchases of hot rolled steel in the States are limited to small tonnage of hot rolled bars, 4 in. and larger, but, as we have ample stocks of these sizes on hand for some time, we do not think it will seriously interfere with our work. As we are large users of cold drawn steel, it may affect us, as we understand a great amount of steel drawn in this country is done from American bars."

E. Leonard & Sons, Limited, London, Ont., manufacturers of engines and boilers, state: "We have material on hand (or in transit) sufficient to cover the majority of orders now on our books. We also have a small stock of standard boiler plates, tubes, etc., with which we think we can take care of any orders that may come in for standard articles during the next month or six weeks. Orders for special boilers requiring special material would be delayed through the present strike."

Wm. Inglis, president of the John Inglis Company, Limited, Toronto, engineers and boiler makers: "I do not believe that this strike will amount to anything as far as Canadian business is concerned, as I understand the steel companies are taking care of all the business for this country under present conditions, as the mills that are affected do not make material that we import."

The Hamilton Bridge Works Company, Limited: "If the strike continues indefinitely and extends further, it is only a matter of time before firms in similar lines to ourselves will be unable to operate, for the reason that a large percentage of our materials, such as plates and structurals, come from the United States. At the present time only a small range of angles are manufactured in this country, and, therefore, our requirements cannot be obtained in Canada, and obtaining supplies from Britain and the Continent is out of the question at the present time. The Algoma Steel Corporation, Ltd., of Sault Ste. Marie, expect to be in a position in a few weeks to be rolling beams and channels up to 15 in. and angles up to 6 in. x 6 in., and as soon as this program is carried out some relief will be obtained."

Inquiry at the Dominion Shipbuilding Yards, Toronto, brought out the information that they have enough plate in stock to finish the two ships at present laid down. This will carry them through the winter, so they will not be affected, unless the strike extends over six months. Apart from the actual supply of material, the Dominion yards report they have plenty of labor, but the Port Arthur yards are having difficulty in getting men. Mr. Miller of the Port Arthur Shipbuilding Co. was in town a few days ago looking for riveters.

A despatch from St. Catharines says: The shortage of tin plate, caused by the steel strike in the United States, is causing a great deal of inconvenience among the canners and growers throughout the whole province. This district is especially hard hit, a few canneries being compelled to shut down owing to their stock of cans having become exhausted. The plants of the Dominion Canners at Welland and Niagara-on-the-Lake are closed, and the plant at Jordan Station will have to close.

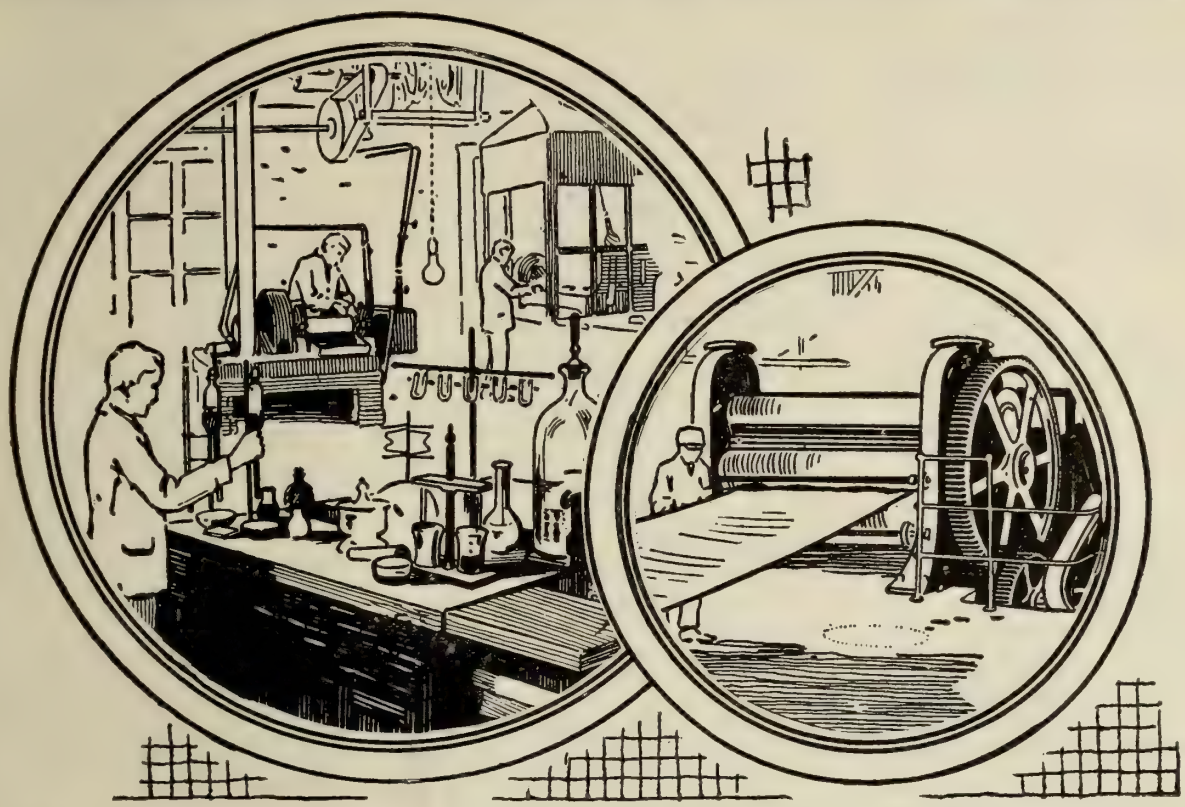
The Schenck plant, in this city, has a sufficient supply for to-day, while the Simcoe plant has by far the best supply, and will be able to keep in operation for a few days to come.

The Position in Montreal

MONTREAL, Que., Oct. 2.—The Steel Company of Canada continue to operate on a fair volume of business which may have shown a slight increase during the past week, which condition may have developed as a result of the steel situation in the States. Officials of the Steel Company state that it is largely heavy products, such as steel plates and shapes, that will be affected by the strike, and as the business in this direction is comparatively light at present, and a conservative policy is practised by builder and manufacturer, the Canadian situation will not feel the brunt of the strike in the States. Asked as to whether there was any danger of the strike spreading to this country, the official did not think so, and was under the impression that the strike among the American steel mills would be nearer a settlement by the end of the week. This appears to be the general opinion among steel men here.

The purchasing department of the Canadian Pacific Railway advises that the present requirements for steel supplies are such that the strike in the States has had little effect so far. In anticipation of a strike some time ago, they took care to obtain sufficient material to carry them over a reasonable period of idleness at the mills. In addition to this, their present steel requirements are not excessive, and unless the situation takes a more serious turn, they expect they will be able to carry on without being seriously hit by conditions in the steel districts.

Officials of the Montreal Locomotive Works report no serious effect as a result of the strike in the States. As a matter of fact, the plant here is operating much below normal, and their present requirements are not sufficient to feel the pressure of restricted supplies. They are optimistic regarding the strike and believe that a settlement will be reached within a short time. They state, however, that a long strike would materially upset the plans of Canadian manufacturers, as American conditions would naturally be reflected here, in which case the curtailed production of steel would be experienced all along the line. Considerable stock is now on hand, and with the small business booked, will be sufficient to carry them along for some time.



The Quality Standard That Produces "Plus Service" Belting

The only sure way to get satisfactory service is to buy products of known worth.

In Dominion Rubber System Belting, the worth is known because every ounce of material—each individual operation and each finished belt must test up to the highest quality standard ever made for belting.

From the time the materials come into our factory until the belt is running on your pulleys, there is no chance of your getting anything but "plus service" belting.

This is the result of over fifty years of belt making experience and research by the oldest, largest and most completely equipped rubber organization in Canada.

The rubber that goes into Dominion Friction Surfacing Belting is not a mere waterproofing substance—our chemists have given it a far greater value by making it into a friction compound that prevents practically all power wastage on the pulleys.

"Plus service" includes the free technical advice of our belting engineers who are ready to help you with your transmission and conveying problems without placing you under obligation to us.

A phone call, wire or letter to our nearest branch places all of our facilities at your disposal.

MONTREAL NOTES

Sometime ago it was announced that Paul Mercier, chief engineer of the city of Montreal, was resigning from the position. It is now learned that he will not be entirely dissociated from the affairs of the city, as he has been retained in the employ of the ratepayers as a consulting engineer. His time, however, will only be partly occupied in this connection, as he will join the staff of the Ecole Polytechnique as an instructor and lecturer.

* * *

On the recommendation of the chief of the fire department the Administrative Commission of the city of Montreal have under consideration the revision of the regulations regarding the installation of dry sprinkler systems in big office buildings and inudstrial plants, so that hose connections from the outside could be utilized when conditions prevent the access to the interior. A revised by-law is now before the council for their approval and ratification.

* * *

The shipbuilding plant of the Canadian Vickers Limited was the scene of a serious accident last week, when one man was so badly injured that he died shortly after, and fourteen or more were so seriously hurt that they required medical attendance either at the plant or at the hospital. It is supposed that an acetylene tank had been placed too close to an open fire and that the tank had become overheated, resulting in the explosion. The effect of the explosion was to wreck the walls of the adjoining building and break almost all of the glass in the side and the roof in which the accident took place.

* * *

Should the railway strike in England continue for any length of time there is the probability that the shipping activities will be seriously interfered with, as the inability to remove the goods from the respective wharfs will cause a congestion that can have only one result, the practical embargo of imports and exports of anything but the most essential products. This condition has not yet been felt here, but it is not unlikely that some action will be taken within the week. Prior notification to this effect has already been issued by the British embassy at Washington, and a confirmation of this order is almost imminent.

* * *

During the recent stay of the C. P. O. S. liner Corsican in the port of Montreal, a test was made of a new apparatus designed to facilitate the lowering of lifeboats from a vessel at sea. The device is a simple attachment of skids placed over the ordinary lifeboat, and it was shown that, no matter what angle the ship may be listed at, the presence of these skids permits the lowering of these boats with perfect ease and safety. This appliance was designed by Mr. Hylands, of New York, and has already been adopted by the United States Navy and the U. S. Shipping Board, and the recent demonstration at Montreal was effected with a view of introducing the invention in Canada.

* * *

For many months the Dominion Bridge Company have been actively engaged in the making of machinery for the paper industry. While in some respects the initial work was more or less in the nature of experiments, the rapid growth and the future needs of this great Canadian industry has practically decided the officials of this company to manufacture this line of equipment as part of their post-war developments. The bulk of the machinery now used in the pulp and paper mills has been imported from other countries, but the enterprise of this firm will enable them to supply Canadian-made products for Canadian production. It is believed that contracts have already been made with some of the provincial mills.

* * *

Members of the Kiwanis Club recently paid a visit to the Angus shops of the C. P. R., and had the opportunity of viewing the activities that are going on at these works. They were royally entertained by the officials of the company, lunch being served in the dining room at the plant. It might be mentioned that some of their past activities have been the production of 77 large locomotives in a year, in addition to about 338 passenger and 6,530 freight cars. At present the shops are engaged in heavy repairs to 50 locomotives and are also turning out four new ones a month. They are also repairing about 100 freight cars and eight passenger coaches per day. Among the new productions are refrigerator and flat cars, as well as a new type of all-steel tourist coaches, of which thirty are being made.

* * *

Some comment has been made by manufacturers here on the report from England, that Canadian manufacturers are taking orders that they cannot fill, or cancelling the same after they have once been accepted. It is stated that in many cases Canadian manufacturers here are unable to take care of the business that is offered, but the real fault lies with the brokers and commission agents, who are too ready to accept export business before ascertaining whether the goods or articles can be supplied. It is generally contended that strikes and industrial disturbances have prevented anything like capacity production, a condition that is seldom attained in reorganization or reconstruction periods. Large quantities of manufactured goods, for variety requirements, are being demanded by foreign countries, but combination of circumstances prevent the handling of these goods.

* * *

On Saturday of last week the cargo steamer "Alsace" was successfully launched from the yard of the Canadian Vickers Limited. The vessel was first consecrated by the French clergy here, and the ribbon was then cut by Madame Begard, wife of Capt. L. Begard, the representative of Cie Francaise d'Armement d'Importation de Nitrate de Soude, of Paris, France, for which company the vessel was built. The S. S. Alsace is a single screw steamer of approximately 8,400 tons and will have a speed of about 11 knots. She is 400 feet long, 52 feet beam and with a depth of 31 feet. She is especially designed for the nitrate trade from Chili to France. and is fully up to the requirements of the French Board of Trade and Lloyds 100-AE classification. It is expected that the vessel will be completed and ready for loading in the course of three or four weeks.

ST. JOHN, N.B., NOTES

ST. JOHN.—Damage to the extent of some $25,000 was done this week in the destruction by fire of two warehouses owned by the Wallace Machinery Works, at Sussex, N.B. Some material in the warehouses was destroyed, including eight threshing machines, wood-cutters, and some valuable patterns. The loss was partly insured.

* * *

A new pork-packing plant is to be established at Moncton, N.B., by two St. John men, Walter Jones and Wm. Davis, under the firm name of Jones and Davis. They have purchased land and begun construction of the plant which will have a front of 50 feet, and in which modern machinery will be installed.

* * *

H. J. Ramshaw, of Hamilton, Ont., manager of the Garlock Packing Co., was in St. John this week and established a branch of the company here. They will carry a stock of engines and other apparatus for industrial plants. The branch will serve as a distributing centre for the maritime provinces.

* * *

Capt. William Burrill has returned home after a lengthy period of service overseas. He left here in June, 1915, as paymaster with the 26th Battalion, and went to France with it that year. With the exception of a brief visit home for a few days last spring he has since been overseas. He was formerly with the Canadian Fairbanks-Morse, Ltd., in St. John.

* * *

Plans for the supplying of power from the Nepisiquit River will come before the Provincial Government at its meeting in Fredericton, N.B., next week. The power is for the Bathurst Lumber Co., to supply their pulp mills, and will be an important factor if the Government approves of the scheme.

* * *

Work was begun this week on the construction of a new brick addition to the buildings of John Palmer, Ltd., at Fredericton, N.B. The work will give an additional floor space of 15,000 feet for the oil tanning footwear department. The construction work is in charge of John C. Smith and the contract represents approximately $25,000. It will be quite an addition to this manufacturing concern's plant.

PERSONALS

James R. McNeil, who recently resigned his position as manager of No. 11 colliery of the Dominion Coal Co., to assume charge of the Florence mine, of the Nova Scotia Steel and Coal Co., at New Glasgow, has entered upon his new duties. Mr. McNeil's engagement by the Scotia Co. follows closely upon the appointment of Mr. A. S. McNeil as superintendent of mines of the Nova Scotia Steel & Coal Co., and D. H. McLean as manager of their Princess mines, both of whom severed their connection with the Dominion Coal Co. to take up new responsibilities with the Co. on the north side of the harbor. The Florence, or No. 3 mine, is Scotia's largest producer with a daily output of between 800 and 900 tons.

TENDERS

Tenders will be received up till October 6, 1919, for the construction of a grain conveyor in St. John Harbor, N.B. Plans and specifications can be obtained at the Department of Public Works, Ottawa, or at the offices of the District Engineers, Shaughnessy Building, Montreal, and Equity Building, Toronto, also the engineer in charge, St. John, N.B.

TRADE GOSSIP

Equipment Wanted.—C. P. Wilson Co., 509 Lumsden Building, Toronto, are in the market for a travelling crane; also a locomotive crane, both of ten-ton capacity.

Wants Machinery.—G. W. Allan, of Allan & McKelvie, Engineering Co., Ltd., Vancouver, has been in the east on his way to the Philadelphia convention. He is in the market for an open-sided planer and a miller. His firm is going in for saw-mill machinery.

Leaside Shops Busy.—There are a good number of locomotives and coaches being overhauled at the Leaside shops of the C. N. R. More men are being take on from day to day, and it will soon be necessary to add another coach to the work train which runs daily from North Toronto.

Busy Ingersoll.—Mayor Buchanan, Ingersoll, Ont., reports that all industries there, including two new ones added during the year, are in a thriving condition. The town has available for immediate use a building of 25,000 feet floor space, suitable for manufacturing purposes. Its location is most favorable, standing as it does between the two lines of railway serving the town.

Error in Classification.—Owing to an error in classification, the Volta Manufacturing Co., of Welland, has not been fully listed in our Buyers' Directory. The name now appears under the following headings: Electric furnaces, drum controls, electric furnace regulators, winches, roof coolers, and electrode holders, electric hoists, stationary and monorail, cranes, overhead (hand and electric), current transformers.

Increase Capital.—The Lufkin Rule Co. are increasing their capital from $100,000 to $150,000 by adding 5,000 shares of $10 each.

Plant Extending.—The latest branch of industry to announce an extension is the Brantford Oven & Rack Co., which will double its plant here owing to increased demands for its output. Almost every factory in the city has either extended this year or is working on plans for such extension, and the boom is not inflated, as never were building costs so great. It is expected that within a few days another important announcement will be made along industrial lines.

Machine Tools, Etc.—The import department of a firm with head office in Calcutta and branches in New York and London, desires to secure representation in India for Canadian manufacturers. They are interested chiefly in machine tools, mill and factory equipment, marine and stationary engines, electrical apparatus, motor cars and equipment. Their organization is exceptionally strong. References, particulars by addressing Trade and Commerce Dept., Ottawa, and referring to No. 2767.

Canadian Steel Corporation.—Although actual construction has been held back rather than rushed, the work on the plant of the Canadian Steel Corporation at Ojibway has been going on slowly. One foundation for a 600-ton furnace is now in and work started on a second. Speaking of costs, one of the Steel Corporation men told CANADIAN MACHINERY that the foundation of a 600-ton blast furnace now cost as much as a complete 250-ton stack in pre-war days. Although no definite plans are yet announced, it is known that the Canadian Steel Corporation have big plans under way for the Ojibway plant.

of the Engineering and Machinery Corporation of Canada, St. Catharines, are paying a bonus of 5 per cent. to all their workmen, on the year's wages ending July 31 last.

The Electric Furnace.—At a recent conference of metallurgical specialists in Chicago, an Electric Furnace Association was formed with Atchison Smith, Niagara Falls, N.Y., as president. Membership is open to Canadians interested in the development and manufacture of electric furnaces, materials, supplies or equipment. It is becoming increasingly evident that the electric furnace is about to become a big factor in the metal industry, not only in connection with the production of steel and steel castings, but also in malleable and grey iron castings. An authority states it to be an established fact that the strength of a grey iron casting poured from an electric furnace can be improved from 50 to 90 per cent.

For Trade Abroad.—If any Canadians are interested in the following, write: Intelligence Branch, Trade and Commerce Department, Ottawa, and refer to 15 R. S.—Steel and iron products, machinery, etc.—A returned soldier who spent four years with the Canadian army in France, having technical and practical knowledge of the production and distribution of steel and iron products, machinery, etc, possessing a board commercial and business training, and extensively traveled, would like to get in touch with manufacturers or others who are desirous of establishing or increasing European trade. Before the war he held the position of sales manager for an important firm dealing in iron and steel products.

Plant Changes Hands.—The plant of the Canadian Aeroplane Ltd., on Dufferin street, north of Lappin avenue, has been sold by the Imperial Munitions Board to the Columbia Graphophone Company for $600,000. With the single exception of the Massey-Harris works this is the largest plant under one roof in Toronto. It was used for the building of aeroplanes during the war. The building is two storeys high, of concrete and brick construction and contains over 250,000 square feet of floor space, while the site contains a little over 10 acres. The frontage on Dufferin begins a few yards north of the corner of Lappin and Dufferin on the west side and runs north 333 feet, while the depth of the site is exactly a quarter of a mile.

New Steel Cars.—The first of approximately 100 new steel passenger cars was delivered to the Canadian National Railways, and it is confidently expected that the entire order, comprising six classes of cars, will be completed by the end of January, 1920. It has been thought that the Canadian builders might have been tampered by the convulsion in labor in the steel trade in the United States, but Mr. George E. Smart, General Master Car Builder of the C.N.R., who has been to the affected centres investigating, reports to-day that the steel for the "National" cars was shipped just prior to the outbreak of trouble at the great steel plants. The new steel passenger equipment under order for the C.N.R., includes 20 tourist cars, 18 standard sleeping cars, 9 dining cars, 20 mail cars, 20 first-class coaches, and 13 compartment observation cars. Travel has been heavy all through the summer season, and the C.N.R. is inaugurating shortly new trains to round out a daily transcontinental service in both directions across Canada. The new steel equipment that is now under construction for the National lines is most modern in every respect.

Want a Six-Hour Day.—The United Mine Workers of America at a recent convention formulated demands for a six-hour day, 60 per cent. increase in all mine wages, and a five-day week, with time and a half for overtime and double time for holidays and Sundays. The convention adjourned to await the result of the joint wage scale conference, with the operators of the central competitive district. If a satisfactory issue is made of this conference they

will reconvene at Indianapolis to accept or reject it. If no agreement is ratified before November 1 a general strike of bituminous miners will automatically ensue on that date. This may easily extend to the Canadian fields if the International officers so decree.

One of the things we all do well is to forget.

Names that were household words yesterday are gone to-day.

Because people knew your Name and your Line a year ago it is no sign they do to-day. They forget easily.

Keep yourself in the public mind by advertising. It is just as important to make old friends remember as it is to win new friends. Advertising does both.

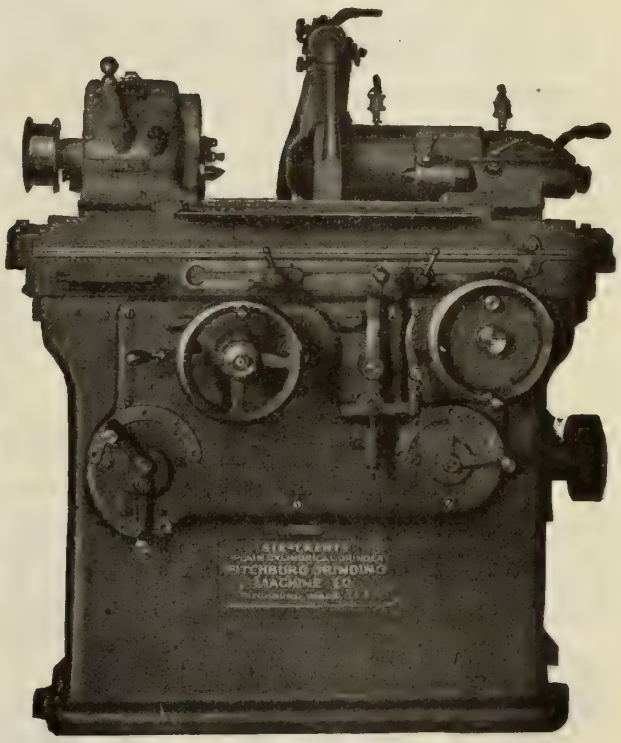
PLAIN CYLINDRICAL GRINDING MACHINES

Model "A" 8" x 36"

in Toronto Stock



This grinder is designed with extra heavy rigid saddle and headstock of rugged design. The capacity of machine eliminates the necessity of purchasing a heavier machine, for the design allows for wheels up to 3" in width. It is especially adapted for automobile parts where production counts.

Size of Grinding Wheel....16" diameter 1" to 3" face 5" hole.
Number of Grinding Wheel Speeds, 2; 1400 to 1640 R.P.M.
Number of Work Speeds, 6; 64 to 340 R.P.M.
Number of Table Feeds, 6; 28" to 150" per min.

This machine will interest you. Write for our Model A circular.

Welding and Cutting Apparatus

Canadian Rights for Sale Covering Well-Known and Profitable Oxy-Acetylene and Oxy-Hydrogen Welding and Cutting Equipment.

An excellent opportunity is offered to established brass manufacturing shop or a small manufacturing company to be organized to produce in Canada complete line of welding and cutting apparatus.

This equipment was placed on the United States market early in 1918, is fully protected by United States patents, and Canadian patents have been applied for within the required time.

Already being sold in Canada to an extent which will insure success of Canadian manufacturing company. Can be handled either direct or through jobbers. Net profits very large.

Patents, complete blue prints and specifications of entire line, as well as initial services of designer and inventor, may be obtained at a reasonable figure.

Nichrome Castings

for Heat Treatment

Cast Nichrome may be machined without great difficulty. With the machined gas sealing cover, furnished with the "Sealtite" pot as shown in the figure, no fire-clay is required for sealing the cover, and the heat treatment penetration shows a large percentage increase over that of iron and steel pots.

According to the noted Italian physicist, Dr. F. Giolitti, carbon monoxide is the most active agent in the cementation and case-hardening of steel.

The taper-fit gas seal of the patented "Sealtite" pot lasts as long as the pot is serviceable. The gases necessary for carbonizing are confined within the container and it has been shown that an increasing depth of case results from the increased gas pressure.

A considerable saving in time and carbonaceous compound has been obtained by some users of the "Sealtite" pot.

Write for further particulars.

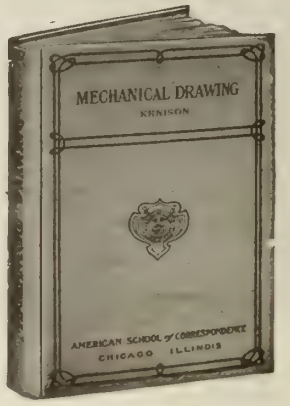
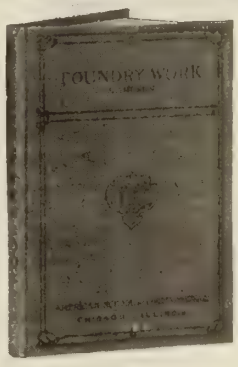
Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

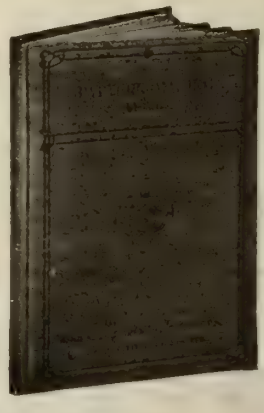
MACHINE-SHOP WORK. By **Frederick W. Turner,** Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price $2.00



MECHANICAL DRAWING. By **Ervin Kenison, S.B., Assistant** Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.25

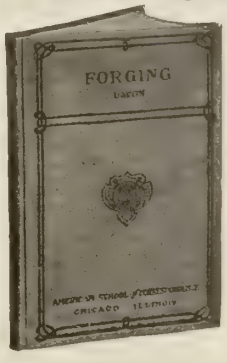


FOUNDRY WORK. Revised by Burton L. Gray, instructor in Foundry Practice, Worcester Polytechnic Institute. 224 pp., 191 illus. Cloth binding. A practical handbook on standard foundry practice, including hand and machine molding, cast iron, malleable iron, steel and brass casting, foundry management, etc. Includes use of various types of molding machines. Price, $1.25



PATTERN MAKING. By **James Ritchey,** Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price.....$1.75

MACHINE DESIGN. By **Charles L. Griffin, S.B.,** Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price ... $1.75



FORGING. By **John Lord Bacon,** Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.25

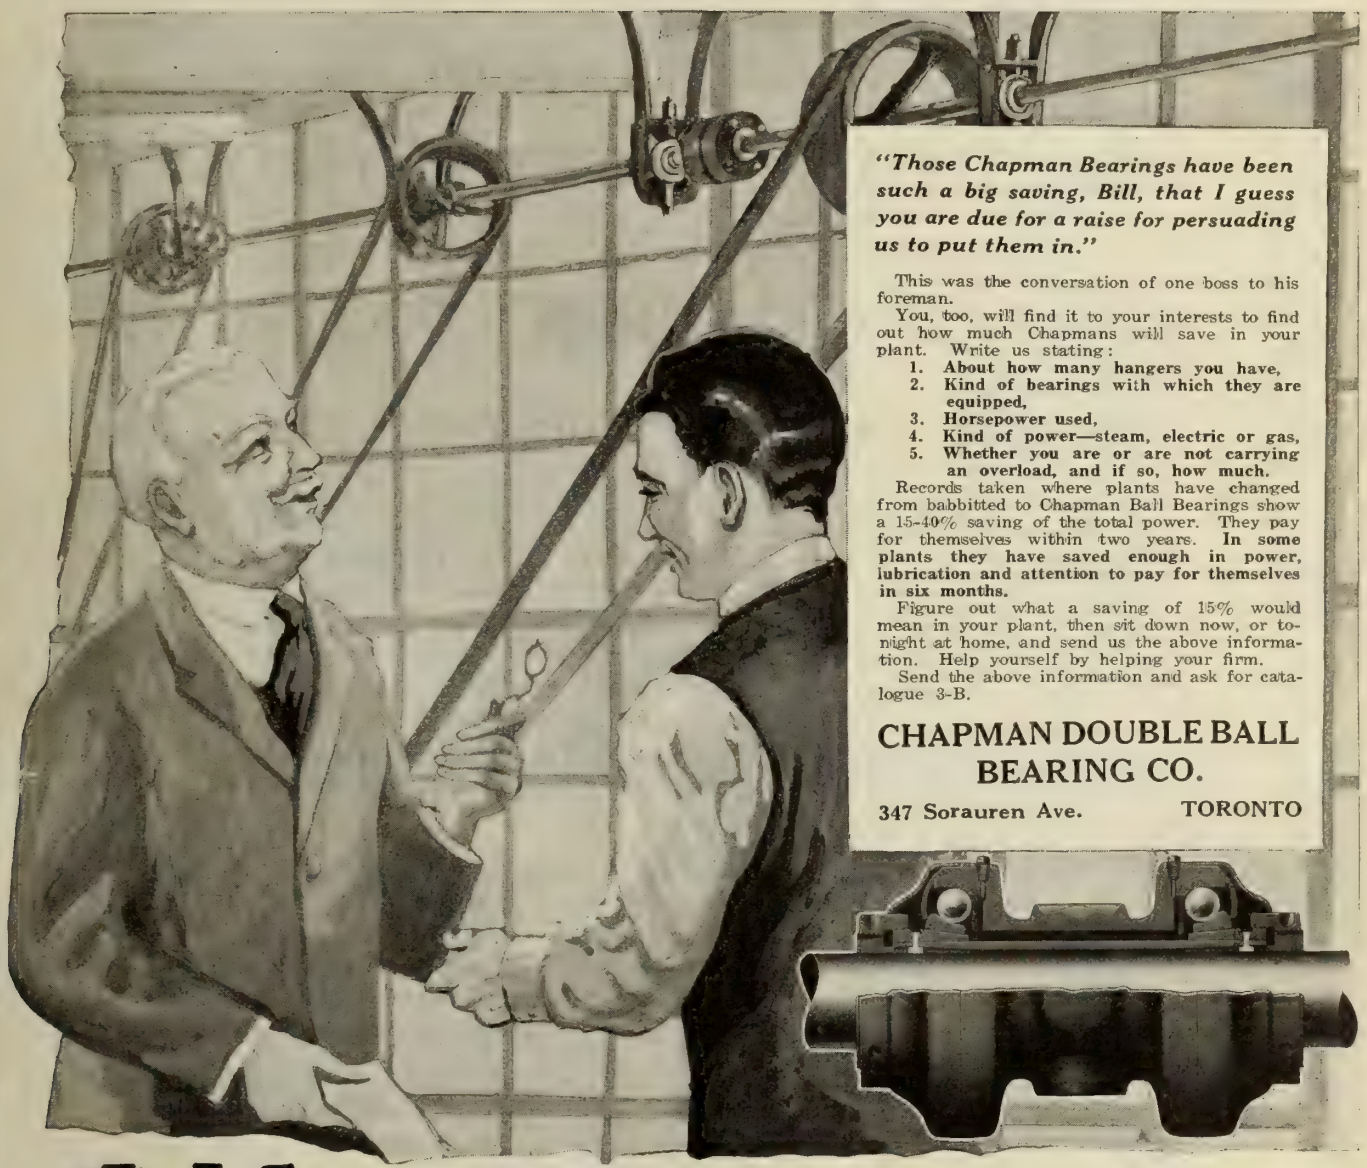
TOOL MAKING. By **Edward R. Markham,** Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers. Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.75

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

Technical Book Department

MacLean Publishing Company **143 University Ave., Toronto**

RAISED!



"Those Chapman Bearings have been such a big saving, Bill, that I guess you are due for a raise for persuading us to put them in."

This was the conversation of one boss to his foreman.

You, too, will find it to your interests to find out how much Chapmans will save in your plant. Write us stating:

1. **About how many hangers you have,**
2. **Kind of bearings with which they are equipped,**
3. **Horsepower used,**
4. **Kind of power—steam, electric or gas,**
5. **Whether you are or are not carrying an overload, and if so, how much.**

Records taken where plants have changed from babbitted to Chapman Ball Bearings show a 15-40% saving of the total power. They pay for themselves within two years. **In some plants they have saved enough in power, lubrication and attention to pay for themselves in six months.**

Figure out what a saving of 15% would mean in your plant, then sit down now, or tonight at home, and send us the above information. Help yourself by helping your firm.

Send the above information and ask for catalogue 3-B.

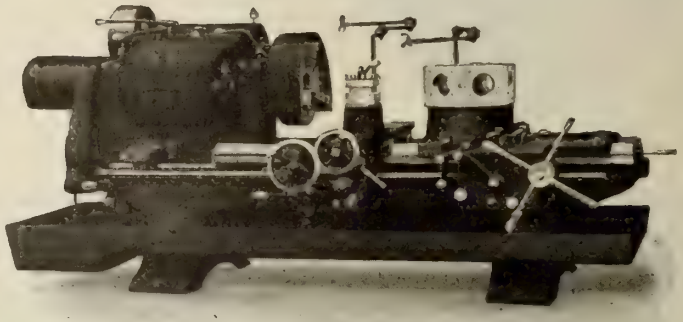
Foster Universal Turret Lathe

THREE SIZES

1---B

2---B

3---B



EQUALLY EFFICIENT ON BAR AND CHUCKING WORK

DO YOU HAVE ANY IDLE MACHINES IN YOUR FACTORY?

You probably do.

The character of the work has been shifting. Only a few months ago the war created a demand for certain articles, and your factory equipment had to be changed to meet it. To-day the past war reconstruction calls for products of another kind.

If your factory equipment is not flexible enough, if your machine tools are not capable of being adapted to the periodic changes in the character of your work, there will be idle machines in your factory eating into your profit even though you are flooded with orders.

The UNIVERSAL TURRET LATHE will adapt itself readily to the changing character of your work. It can be changed over from bar work to chucking work or vice versa in a short time and is equally efficient on either.

Furthermore, the Universal Turret Lathe will keep down your production cost to the minimum, no matter whether you handle your work in lots of 10 or 10,000 parts.

YOU CANNOT AFFORD TO IGNORE THE MERITS OF THIS MACHINE. WRITE FOR OUR CATALOGUE AND LEARN MORE ABOUT IT. THEN SEND US BLUE PRINTS OF YOUR WORK AND LET OUR ENGINEERS FIGURE WITH YOU.

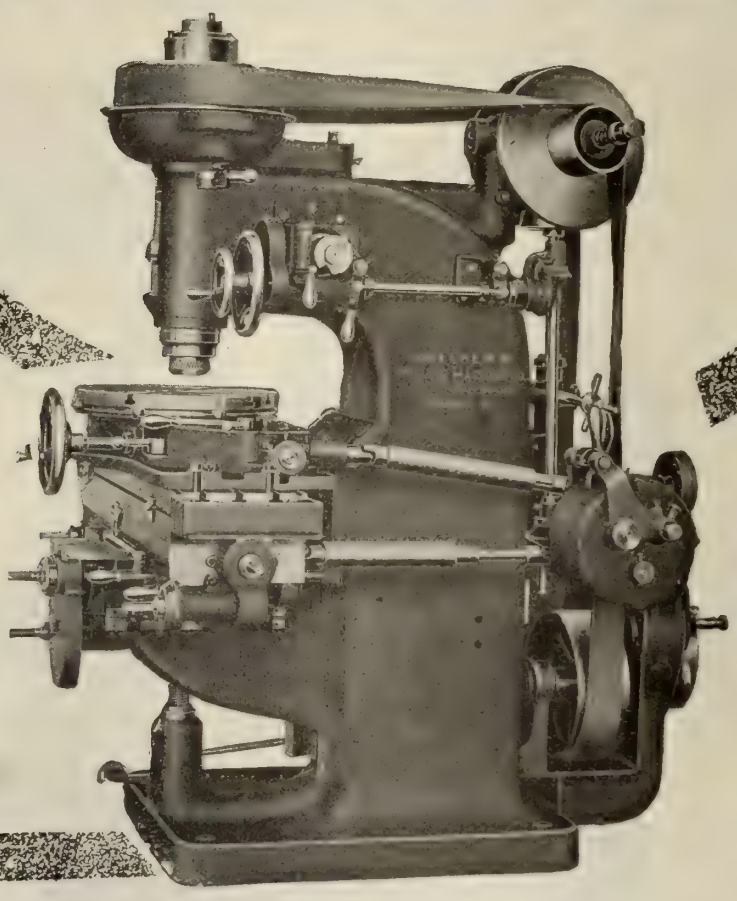
Becker



"Becker Belt Driven Millers"

The Machine that gives the Smooth Finish

Model B

The machine shown above is a Becker Model B Belt Driven Miller—Like the other machines of this line it is a Production Tool of the first class, embodying all the features that have made Becker Millers the standard.

The strenuous period of war work has introduced Becker Belt Driven Millers into Canadian factories. They were essential then because they greatly increased production without adding to manufacturing costs—and now, they are essential also because they will enable you to reduce your manufacturing costs in order to cope with the keen after-war competition.

You need a Becker Belt Driven Miller.

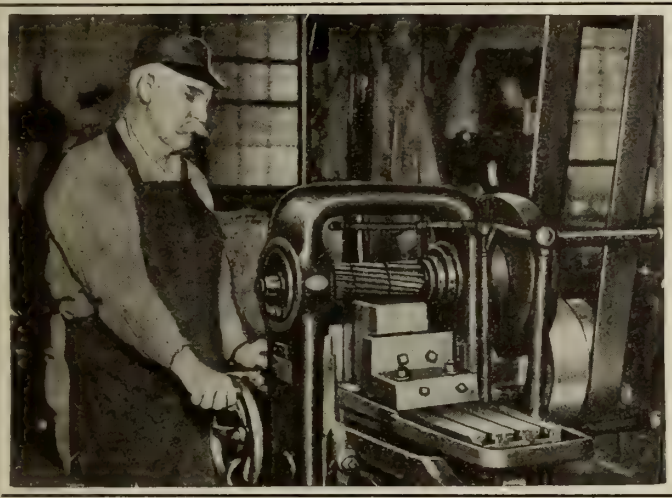
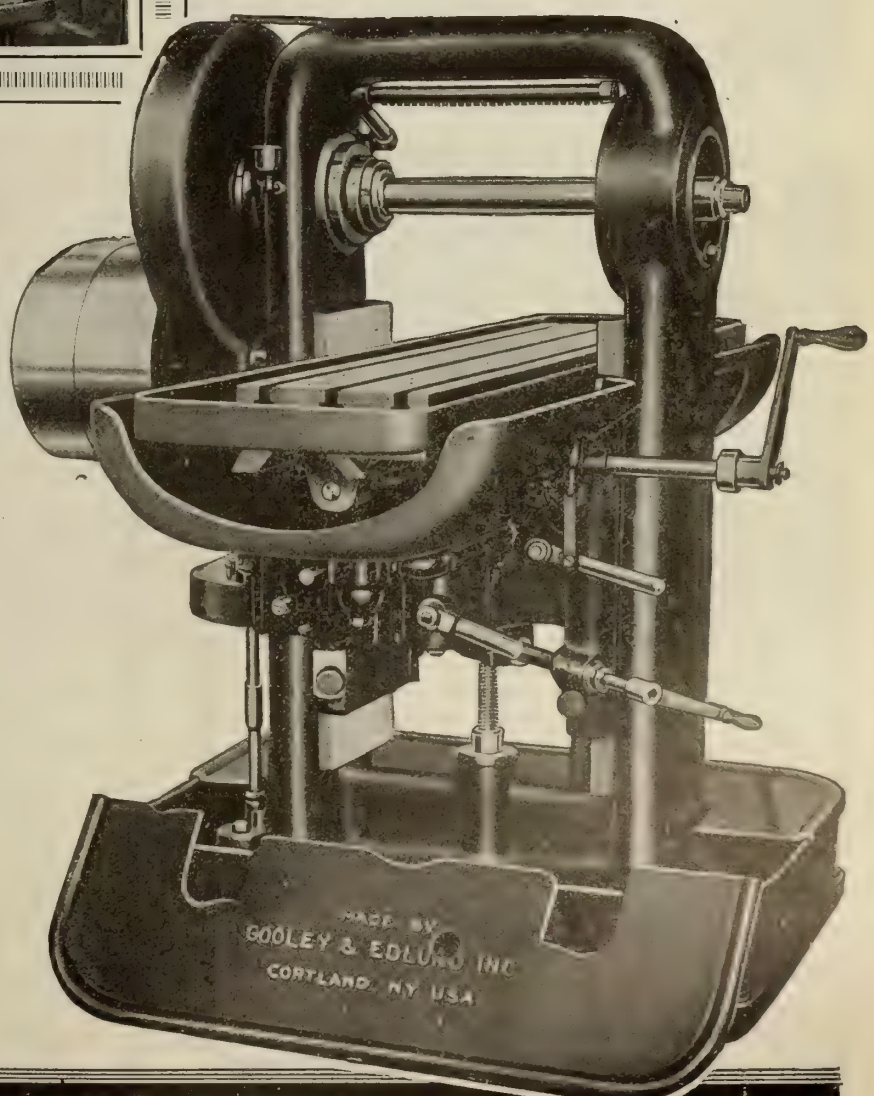
BRIGGS MILLER

Keeps Five Die Sinkers Going





HERE you see the Briggs Miller Squaring Die Blocks, and it is working so fast it keeps five die sinkers going.

Some are new, squared from the rough; some are old, annealed, cut down and made over; some are oblong, some square, in sizes up to 9 inches. This Briggs Miller has been squaring blocks for four years; has never given any trouble. When cutters get dull the operator has another gang ready to go on with the work. Unusual rigidity accounts for Briggs' higher efficiency.

Don't you think you could use this tool to advantage in your shop? Write for the details.

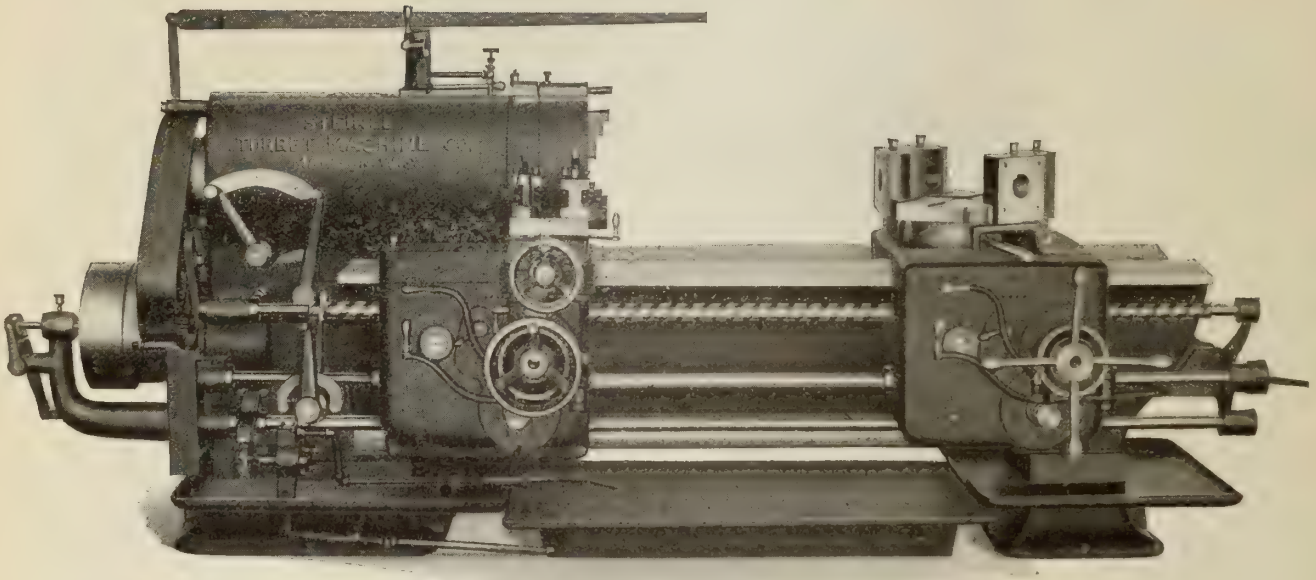
STEINLE



Still another reason why the Steinle 24" Full Swing Side Carriage Turret Lathe is ahead of all others in the economical and accurate production of many classes of work.

THE COMBINATION TURRET

In designing this turret the following points were taken into careful consideration:

The proper manner of supporting different kinds of tool equipment required on a machine of this character.

Avoidance of excessive tool overhang.

Ability to secure the full benefit of the side carriage in relation to the absence of turret tool overhang.

As regularly furnished, the combination turret is hexagon in form, 21" in diameter, and has two open sides and four bored faces. The open sides permit of universal facing heads or similar tool equipment being firmly secured to the bed of the turret and provide for suitable adjustment of tools to the work with a minimum overhang. The bored faces carry drills, boring bars, reamers, die heads, taps, etc.

The combination turret has power traverse and quick change reversible longitudinal feed controlled from the apron.

The bearing on the saddle is the full diameter of the turret. The locking pin is located in front, the greatest possible distance from king pin. One motion of the binding lever releases the pin and turret, or binds same.

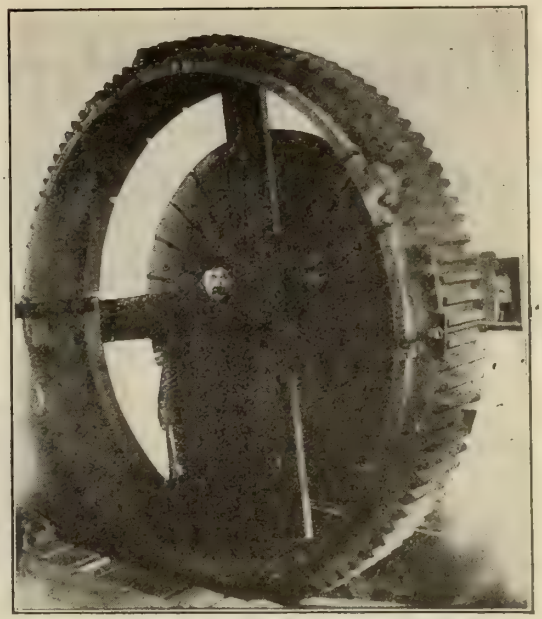
The design of the combination turret secures the full advantage of the side carriage feature.

STEINLE TURRET MACHINE CO.

MADISON - - WISCONSIN, U.S.A.

Economy A Big Factor In "HISCO" Moulded Gears

In the installation of new machinery in the working out of new processes—you may require gears or sets of gears, and no matter what the diameter, the Hisco process relieves you of the necessity of having patterns made—entailing considerable cost and delay.



"HISCO" machine moulded gears, while requiring no pattern, insure accuracy, dependability, quality, and the price is minus the cost of patterns—which in these days of high lumber and wages, and when time is a factor—is something to be considered.

The "HISCO" plant is equipped to produce machine moulded gears up to 18 feet in diameter without patterns—and remember, very often the pattern has cost more than the gears.

The Greenfield Universal Grinder

For General Tool Room Work

This grinder is furnished with attachments for grinding all sorts of milling cutters, reamers, counterbores, and other machine shop tools.

It is also suitable for cylindrical, internal and flat work which frequently turns up in the making of tools and jigs.

These attachments are all very simple in design and easily adjusted upon the machine, being graduated so that any desired angles can be at once obtained.

The whole machine is thoroughly well built, well finished, and will be found a dependable, convenient grinder.

Your Money's Worth

Never again will the Canadian Nation and People be the same careless improvident spenders of "ante bellum" days. "EFFICIENCY" and "GET YOUR MONEY'S WORTH" will be the popular motto and the successful machine shop manager must be able to see the advantage of making one pound of High Speed Tool Steel do the same work as ten pounds in forged tools; in other words he must and will

USE ARMSTRONG TOOL HOLDERS

No heavy "stub-ends" to throw away. No time lost with men at the grinder while lathes stand idle. No stock of heavy sizes of steel to carry, and the blacksmith as a tool-dresser is eliminated entirely.

Armstrong Tools are great favorites with the men—a good thing to consider from a production standpoint.

Our Catalogue is of handy pocket size and will be mailed to you upon request

Photographic Copying
The PHOTOSTAT

(Trade Mark Registered)

"Orders are now delivered three or four days earlier to our customers by making photographic copies of sketches and drawings which are the same in every detail instead of having our draftsmen reproduce the original.

"Practically all orders were previously held up three or four days by our drafting department while copies of the intricate drawings of ordered tools were being made. Now with the Photostat, only 15 or 20 minutes are required to make the three copies, exact duplicates of the original, which the factory needs to turn out the order. By eliminating this needless delay we are able to provide better service for our customers, and attract new prospects because of prompt deliveries."

This cut shows a PHOTOSTAT on which a large drawing has just been copied in less than a minute.

Never Makes a Mistake

It is simple, practical, easy to handle. Requires no expert knowledge. The machine is loaded with a roll of sensitized paper especially manufactured for the purpose.

The original subject is photographed directly upon this paper producing a facsimile copy which is immediately cut off, developed and fixed right in the PHOTOSTAT itself.

The focusing, exposing and developing are all controlled by simple mechanical devices and no glass plate, film or other intermediate negative has to be made.

After fixing, the copy is removed to a tank of running water and rapidly washed free from chemicals. It is then dried and is ready for use. As many copies as desired may be run off in this manner.

By a simple adjustment of the mechanical focusing device the copy may be made at actual size, reduced, or enlarged, within the size limitations of the machine.

Error in copy is impossible because every copy is an absolute facsimile. The operations are all simple, such as a boy or girl can do.

Oxy-Acetylene Welding and Cutting

Reclaimed at Small Cost Defective Castings

Expensive tie-ups are averted by the Prest-O-Lite process of Oxy-Acetylene welding. Frequently one repair will result in a saving of time and money far in excess of the cost of a Prest-O-Lite outfit.

But not only has this process proved itself a great money-saving factor in repair work. It has also been adopted as standard routine practice in many prominent metal working factories in all parts of Canada. The above illustration shows a Prest-O-Lite operator reclaiming defective castings which would ordinarily have found their way to the scrap pile.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Tell men to turn them in when dull and get new ones.

If you specify Famous Five Files when ordering, you can count on getting the right amount of work out of a file before it dulls.

Famous Five Files are accurately ground and cut, and scientifically hardened. Skilled workmen know them as the standard tools. There is one for every kind of work on wood or metal.

They are:

KEARNEY & FOOT

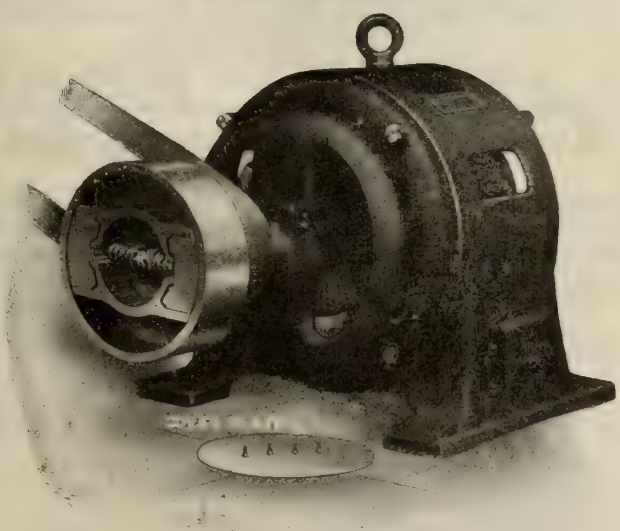
Centrifugal Friction Clutches

To Ensure the Easy Starting of A.C. & Squirrel Cage Motors

½ H.P. to 1500 H.P.



No Motor Should be Without This Simple and Unique Device.

Entirely Dispenses With all Starting Difficulties

The Clutch also Effects a Great Saving in Current Consumption and Reduces the Initial Cost of Motor and Switchgear.

Please Mention Speed and H.P. of Motor When Sending Enquiries and State the Current Supply.

ARMCO IRON Welding Rods

OXY-ACETYLENE ELECTRIC

make *safe* welding easy

Armco Rods are 99.84 per cent. pure iron. No other fillers equal them in purity and uniformity of composition. Two kinds of rods of guaranteed analysis, one for electric and one for oxy-acetylene welding, do all the work (and **better** work) that formerly required many different compositions. Armco Rods flow freely, weld evenly, and give a joint that lends itself practically to all finishing operations. Send for booklet.

Special Belt Problems

Drives that require speeding up or those called upon to give increased power, ofttimes present problems to the engineer or master mechanic. Again, a drive may be required to run in an atmosphere laden with Dust, Gas, Steam or Acid Fumes where a belt could not be considered. Our engineers are ever ready to help on such problems and our experience is yours for the asking.

Save by securing data and estimates of "Morse" Drives.

Save Power! Save Coal!

American Steel Split Pulleys reduce belt slip and air resistance to a minimum. They cut down power wastage and save coal. Guaranteed for double belt service and rim speeds up to 6,000 feet per minute.
Write for 37-page booklet, "Getting Maximum Pulley Efficiency."

THE AMERICAN PULLEY CO.
Philadelphia, Pa.

AMERICAN STEEL SPLIT PULLEYS

LUBRICATING PUMPS

To be efficient should throw a heavy, steady stream of coolant at will of machine operator.

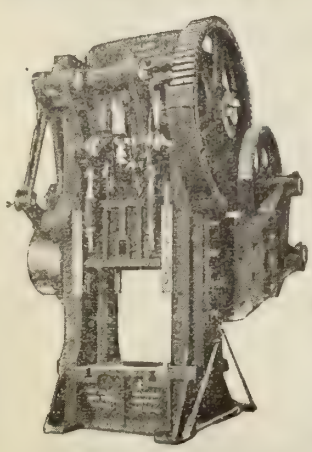
They should be rotary geared to force the coolant into deep cuts and bores. They should operate at low speed, thus insuring long life, but while running at low speed, pumps must also have large capacity.

All of these requisites will be found in the TRAHERN.

Trahern Pump Co. Rockford, Illinois.

The "TOLEDO"

Toggle Drawing Presses



The "Toledo" Toggle Drawing Press
50 sizes, 7500 to 650,000 lbs.

Their performance more than justifies our claims for the one simple, practical, effective toggle mechanism which secures a perfect rest of dwell of the blank holder, exerts all the required power, and eliminates wasters.

For economically and accurately drawing stamped steel and enameled ware, bath tubs, caskets, auto bodies, stove parts and similar articles.

The Canadian Disc Sander is 90% Dustless

Think what a godsend that is to the pattern shop! Hundreds of prominent concerns are profiting immensely by using these sanders.

Two types of Canadian sanders are built—the Disc Sander and the Oscillating Spindle Sander. Both machines are equipped with New Departure ball bearings and General Electric motor. The table in each case can be tilted by a hand adjustment, 45 degrees down or 15 degrees up. Power is obtained by plugging into a lamp socket. Canadian Sanders are extraordinarily well built and are guaranteed against all defects.

Railroad Results

Results reveal more than words—for this reason, we suggest that you inquire in the different shops and judge by what you see and hear about the many accomplishments of

Brown & Sharpe Heavy Service Milling Machines

Then send for our Milling Machine Book which describes the construction of one of the most practical machine tools found in any modern shop.

Brown & Sharpe Mfg. Co.
Providence, R.I., U.S.A.

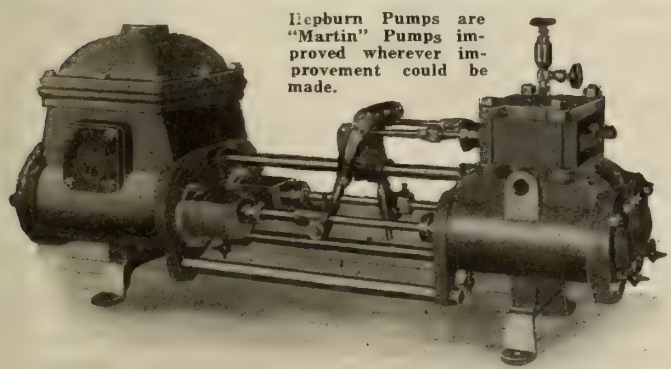
Hepburn Pumping Machinery

Our line embraces standard duplex pumps for boiler feeding and for fire and general service; tank or low service duplex pumps; duplex hydraulic pumps for service in connection with hydraulic lifts and presses, accumulators and oil presses; pressure or mine pumps; horizontal power pumps and air and circulating pumps, etc.

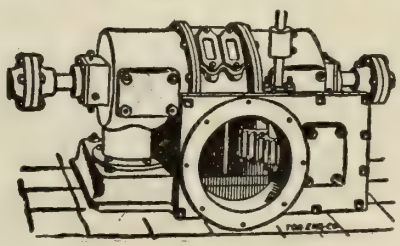


Hepburn Pumps are "Martin" Pumps improved wherever improvement could be made.

JOHN T. HEPBURN, LIMITED

18-60 Van Horne Street Toronto, Ontario

WATER POWER DEVELOPMENT



Over forty years' experience in designing and installing special turbines, both on vertical and horizontal shafts.

Can supply complete equipment, including flume, turbine and power transmission.

Stock of standard vertical shaft Little Giant Turbines on hand for prompt shipment.

We solicit your inquiries.

How The Gear Shaper Cuts Accurate Gears

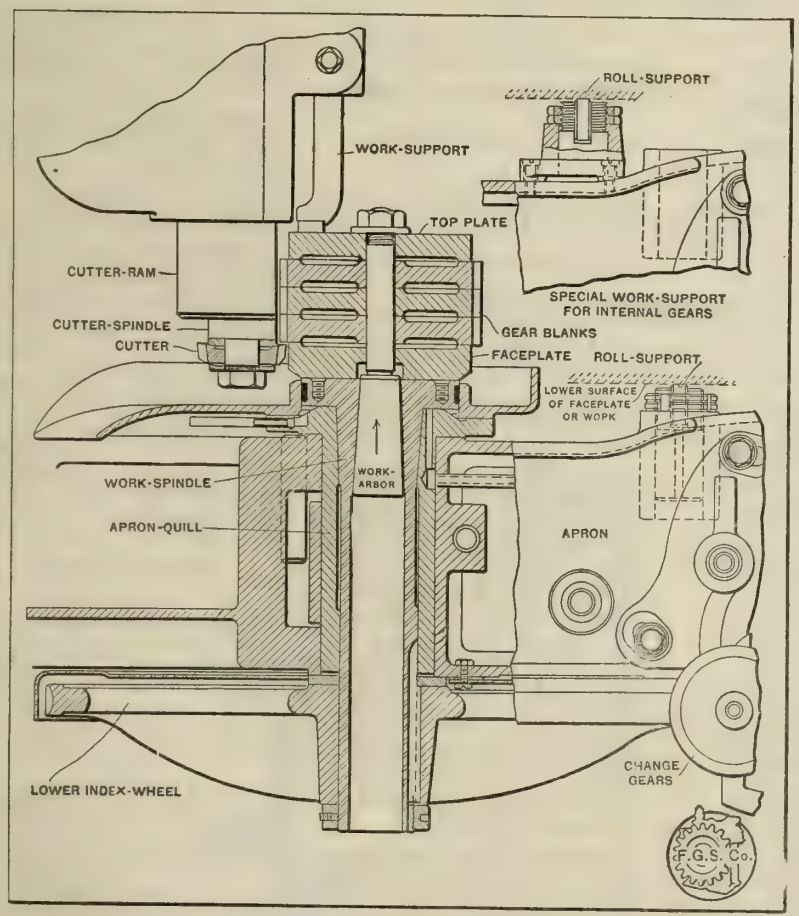
The cutting of accurate gears is not only a question of having an accurate machine and an accurate cutter, but is also a question of the proper application of basic principles in the machine itself.

Gears in which the teeth are not cut concentric with the holes are inaccurate. They are also noisy in operation.

Spur gears in which the teeth do not lie exactly parallel with the axis are also inaccurate and noisy.

In order, therefore, to cut accurate gears, it is necessary that the gears being cut be accurately and rigidly held.

The Gear Shaper method of supporting gears is unique in that the work can be clamped rigidly without springing the work-arbor; also the cutter does not deflect the work when the teeth are being generated.



Section through work-spindle showing rigid method of holding and supporting Gear Blanks.

The accompanying diagram illustrates this point very clearly. The work, it will be noticed, is clamped rigidly to a face-plate. All the arbor does is simply to center the work accurately and furnish the clamping medium.

The tighter the work is clamped, the more rigidly the arbor is held in the spindle, because it has a reverse taper. There is, therefore, no possibility of deflecting the work in cutting, as is the case with other processes where the work is supported by a long slender arbor.

One of the chief advantages of this unique method of supporting the work is that the work can be cut much faster and with a greater degree of accuracy than is possible by any other method.

It will pay you to investigate the many advantages of the Gear Shaper method of cutting gears, which is fully explained in the sixth edition of our general catalogue "Commercial Gear Cutting," copies of which are ready for general distribution to those interested. Simply send your request to—

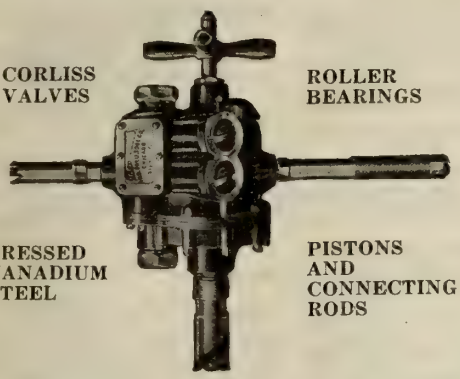
AIR DRILLS



Four cylinders—two on each side—with Semi-Corliss Valve close to each pair, giving greater power and efficiency.

Thor

ALL RECORDS BROKEN FOR SPEED, POWER and ENDURANCE

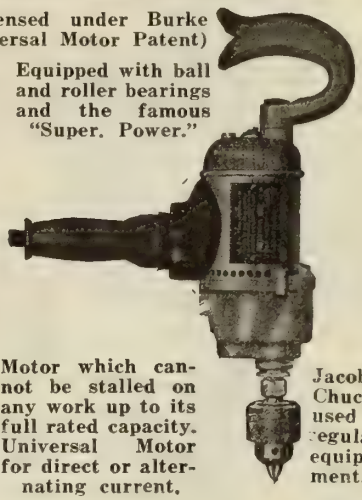
CHIPPING HAMMERS

4 sizes, 1 in. to 5 in.
All parts hardened and ground.

ELECTRIC DRILLS

(Licensed under Burke Universal Motor Patent)

Equipped with ball and roller bearings and the famous "Super. Power."



Motor which cannot be stalled on any work up to its full rated capacity. Universal Motor for direct or alternating current.

Jacob's Chucks used as regular equipment.

Production of Rare Quality at Lowest Labor Costs

There is unusual strength, accuracy, speed, convenience and range in

AURORA Drilling Machines

You can use them to great advantage on any work in your shop that's suitable for a machine tool of this kind. The operating is easy and the labor cost comparatively low.

Drop a line for full particulars and specifications.

Heat Under Accurate Control

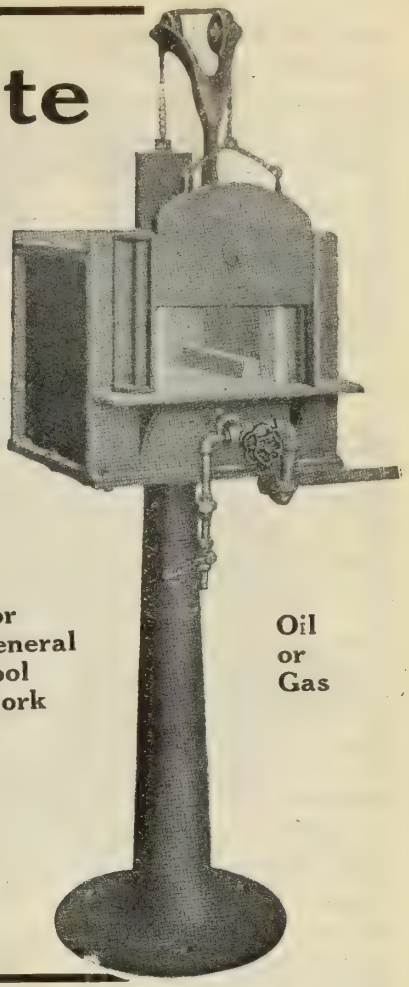
Here is an important factor in the heat treatment of metals. An intense heat, rapidly developed, and always under accurate control of the operator, are features that distinguish

BELLEVUE FURNACES

These tool forges are particularly adapted for the requirements of the small machine shop for annealing and tempering dies, cutters, reamers, etc.

Combustion is perfect and no flames come in contact with material. Built to stand the highest temperature. Doors are properly counterbalanced. In every way BELLEVUE FURNACES meet with the demand for durability, efficiency and convenience.

Let us advise you about your heat-treating problems.



For General Tool Work

The MacLean Business and Class Publications in Canada

TO SELL or buy from Canada such lines as machinery, hardware, food products, dry goods, books and stationery, paper, printing machinery and supplies and general merchandise of almost every description, raw or manufactured, use or consult the MacLean Business and Class Publications, as per list below. For special information, write the publishers. Concerning the quality of the MacLean publications let this copy of CANADIAN MACHINERY which you hold in your hands speak for all. The MacLean list of 15 publications is as follows:

THE CANADIAN GROCER (Est. 1886)
HARDWARE AND METAL (Est. 1889)
DRY GOODS REVIEW (Est. 1889)
MEN'S WEAR REVIEW (Est. 1898)
CANADIAN MACHINERY (1905)
THE POWER HOUSE (1907)
BOOKSELLER AND STATIONER (Est. 1884)
THE SANITARY ENGINEER (Est. 1907)
MARINE ENGINEERING OF CAN. (1910)
CANADIAN MOTOR, TRACTOR AND IMPLEMENT TRADE JOURNAL (Est. 1919)
CANADIAN FOUNDRYMAN (Est. 1909)
PRINTER AND PUBLISHER (Est. 1892)
THE FINANCIAL POST (Est. 1907)
MACLEAN'S MAGAZINE (Est. 1896)
FARMERS' MAGAZINE (Est. 1910)

This fact may interest you: namely, the MacLean organization is the largest concern of its kind in the British Empire. The output of its mechanical department every working day is the equivalent of a 150-page publication of the size and type of this copy of CANADIAN MACHINERY.

Our London Office: 88 Fleet Street, E.C.

Also at: NEW YORK, BOSTON, CHICAGO, MONTREAL, WINNIPEG

For over 20 years the MacLean Publishing Company has maintained a fully-staffed London Office, and has rendered British and Continental manufacturers, shippers, and traders an invaluable service in many directions.

Specimen copies of the MacLean Publications will be cheerfully forwarded to all asking for them. Address us at London or Toronto.

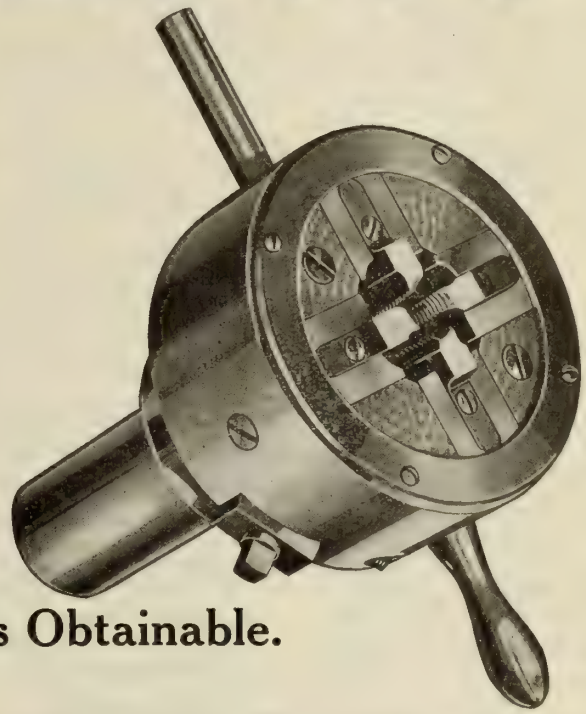
MODERN

Self-Opening Die Heads



The Most Accurate, the Most Dependable, the Most Durable Self-Opening Die Heads Obtainable.

Because of other superior qualities Modern Self-Opening Die Heads have been adopted as Standard Equipment on about 90% of the highest grade turret machines made in America. This is significant because much of the Reputation of any machine depends upon the character and satisfactory operation of the equipment supplied.

Moderns are for use on turret of any hand or automatic screw machine, and when fitted with closing device on lathes, drill presses and other revolving spindle machines.

Moderns offer many advantages over any other die heads obtainable. They're simple in design—have few parts. They do not clog easily. May be quickly and easily cleaned WITHOUT DISMOUNTING, and without taking entirely apart.

Every Modern Self-Opening Die Head has a wide range of diameters which may be cut, thus avoiding the necessity of purchasing a separate head for different jobs.

Modern's chief claim to favor is UNEQUALED ACCURACY. Chasers cannot change position during work. When set they are as rigid as solid heads. Chasers will not "rock," "cock" or "bell at the mouth."

Let us tell you more about these wonderful aids to accuracy and big production in threading operations. Send for bulletins.

OTHER MODERN TOOLS

- —Plain Grinders
- —Universal Grinders
- —Internal Grinders
- —Chaser Grinders
- —"Magic" Chucks
- —Tapping Attachments
- —Collapsible Taps

Is the Alien a Menace?

IN the October issue of MACLEAN'S MAGAZINE a strong presentation is made of the reason why the people of the West are against further foreign immigration.

"The Menace of the Alien" depicts the foreign problem in the Canadian West as it exists to-day, and shows every one of us why we must Canadianize our Ruthenians, Austrians, Slovaks, and our fifty-seven other varieties before we allow any further "unrestricted" immigration.

This article is written by a member of MACLEAN'S MAGAZINE staff who has just returned from a careful, personal investigation of the situation. Shall we have a "White West?" Many Westerners are demanding it. Are the aliens to swing labor into the bosom of the O.B.U.? It is being done—and what must we do to stop it?

The "inside" story of the routing of the Drumheller miner aliens by returned Canadian war veterans is here hold by MACLEAN'S for the first time. What leadership must be substituted for the O.B.U. leadership of these foreigners?

The October issue of MACLEAN'S is a Western number in the sense that it contains many articles and stories of distinctly Western interest. For instance:

X "Those Pesky Farmers Out West"

By Hopkins Moorhouse, author of "Deep Furrows"

They have completely upset the old order of things. No longer will politics consist of the comfortable fight between the Ins and Outs with the old party lines maintained. The grain growers on the Prairies have upset the calculations of the professional politicians and completely changed the face of Dominion politics.

X "Fifty Years in the West"

By Professor W. T, Allison

A breezy and readable sketch of the business career of Winnipeg's veteran business man, James H. Ashdown.

"Further Discoveries of New Lands"

By Vilhjalmur Stefansson

The final and most interesting instalment of Mr. Stefansson's story of his wonderful trip of five years' duration in the Canadian north in which he tells for the first time of finding new continents in the Arctic and hoisting there the Canadian flag.

X "The Banshee Bell"

By Edith G. Bayne

A bright love story laid in the mountains of British Columbia.

Other Splendid Features of October MacLean's

X "The Turmoil at Ottawa"

By J. K. Munro

A comprehensive survey of Dominion politics, written with complete impartiality and absolute candor. It is bright and breezy, with a knock in every line for the politicial opportunists. It plucks many tail feathers from our party leaders.

"Spanish Doubloons"

By Camilla Kenyon

The start of a bright and fascinating serial story by a brilliant young writer. It is the Spanish Main brought up-to-date, treasure hunting with a background of fun and romance.

"The Airy Prince"

By Arthur Beverley Baxter

A complete novelette in which is presented a bird's-eye view of England in time of war. It is one of the most brilliant stories that has been written of recent years.

"His Majesty's Well-Beloved"

By Baroness Orczy

The latest novel by this popular authoress appearing exclusively in MACLEAN'S.

"Ebb and Flow"

By C. W. Stephens

A strong business story laid in the province of Quebec.

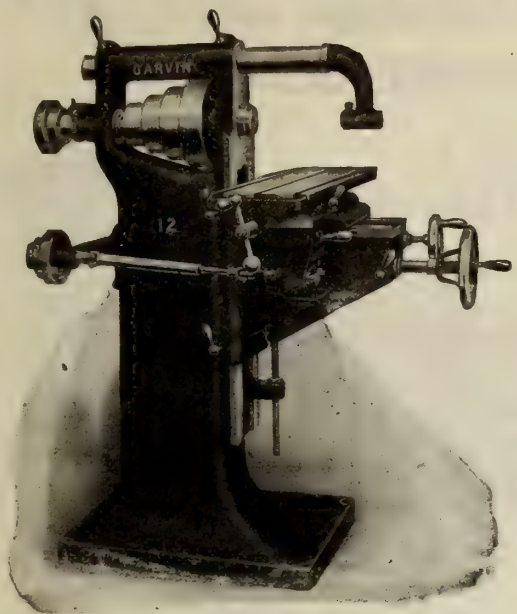
GARVIN



No. 12—Plain Milling Machine—Use Code Abrade

No.12 PLAIN MILLING MACHINE
ALL LIGHT MANUFACTURING

This machine is built especially strong and substantial for a tool of its capacity, and has many valuable features worthy of special mention. The slide is fitted with a quick pitch screw, giving one inch per turn. This combines the rigidity of a rack feed with the steadiness of the screw feed. The table has an oil pan all around it, with finished edges—automatic feed, trip and reverse—adjustable nut on the feed screw to take wear—the Feed Screw is hardened.

Adjustments ..... 18 x 6 x 15 in.

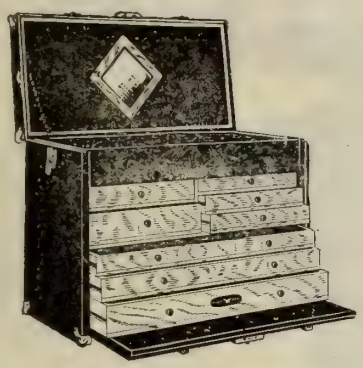
Ask for Quotations on Iron and Steel

We have in stock for immediate shipment the highest grade Bar Iron, Black and Galvanized Sheet Iron, Machine Steel, Cast Steel, High Speed Steel, Cold Rolled Steel, etc.

Machinist's Tool Chests

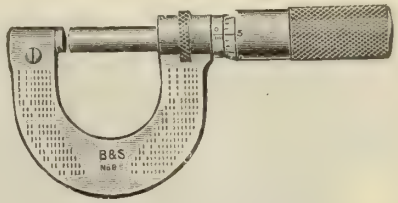


Time and again skilled machinists have remarked on the strength of construction and compact design of our Tool Chests. Have us give you full particulars.

CRESCENT BELT FASTENERS

Clinch beneath the surface of the belt on the pulley side—no part in contact with the pulley. They maintain uniform grip the entire width of belt and never weaken from wear.

Micrometer and other fine tools



Select from such wholly dependable makes as Starrett or Brown & Sharpe, or from other makes you have proven in your own shop to be most durable and efficient. Our stocks are complete.

"Victor" Hack Saw Blades for Tough Metal

Durable, fast-cutting blades that you can rely upon to cut true through toughest metals. Users have found that these blades increase every day's output and serve much longer than ordinary blades.

QUALITY Foss SERVICE

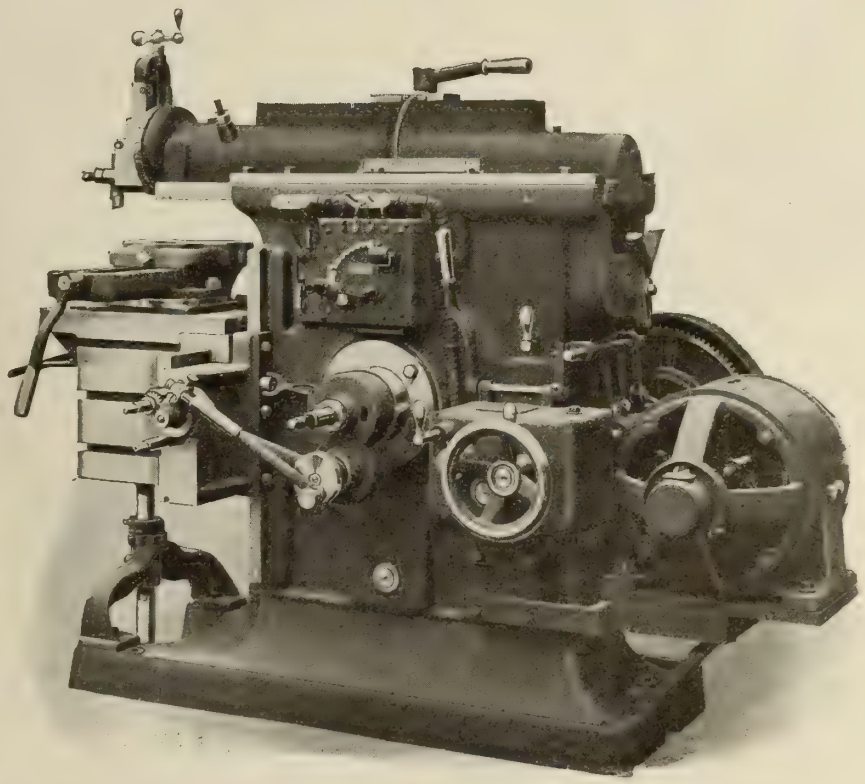
Foss MACHINERY AND MILL SUPPLIES

SMITH & MILLS SHAPERS

Permit Changing the Stroke Without Stopping the Machine

No stopping the flow of production with the Smith and Mills. You can change the length of the stroke, whether to shorten or lengthen it, without stopping the machine. You need only loosen locking screw and stop the shaft revolving and the adjustment is made very quickly.

The helical gear on bull wheel eliminates shock. A wrist-pin gear, fitted to the bull gear in an eccentric form, replaces the conventional bevel gear arrangement in the bull wheel. It's an ideal shaper for speed and accuracy.



Made in both Belt and Motor Driven Types.

PLANERS

SIZES. The 24″ x 24″ x 6′ planer shown above is the smallest planer manufactured by us. We make them in sizes up to 48″ x 48″ and in lengths to suit customers' requirements.

DRIVES. Machines are regularly built with single speed countershaft and standard drive, but can also be supplied with parallel drive or with two speed countershaft or four speed cone variator. Machines may also be arranged for motor drives as follows: With motor directly connected to first gear shaft; with motor mounted on housings and known as plain motor drive; with motor mounted on top of housings and connected to two or three change gear box, or through cone variator.

STAYBOLT TAPS

The Better the Man, the More He Appreciates Them—

Not only good when new, but heat treated and seasoned to maintain this goodness. Can be ground on face of cutting edge without affecting their size.

That's why you'll find Pratt and Whitney Stay Bolt Taps on the job long after cheaper "just as good" tools are buried in the scrap pile.

Threads accurately and cleanly cut, with the least expenditure of time and effort, are other reasons why these better Taps are favorites in the shop.

If you've used them before, you know just how good they are. If you haven't, send us your first order—we know you'll be back for more. They're carried in stock in our sales rooms in all large cities.

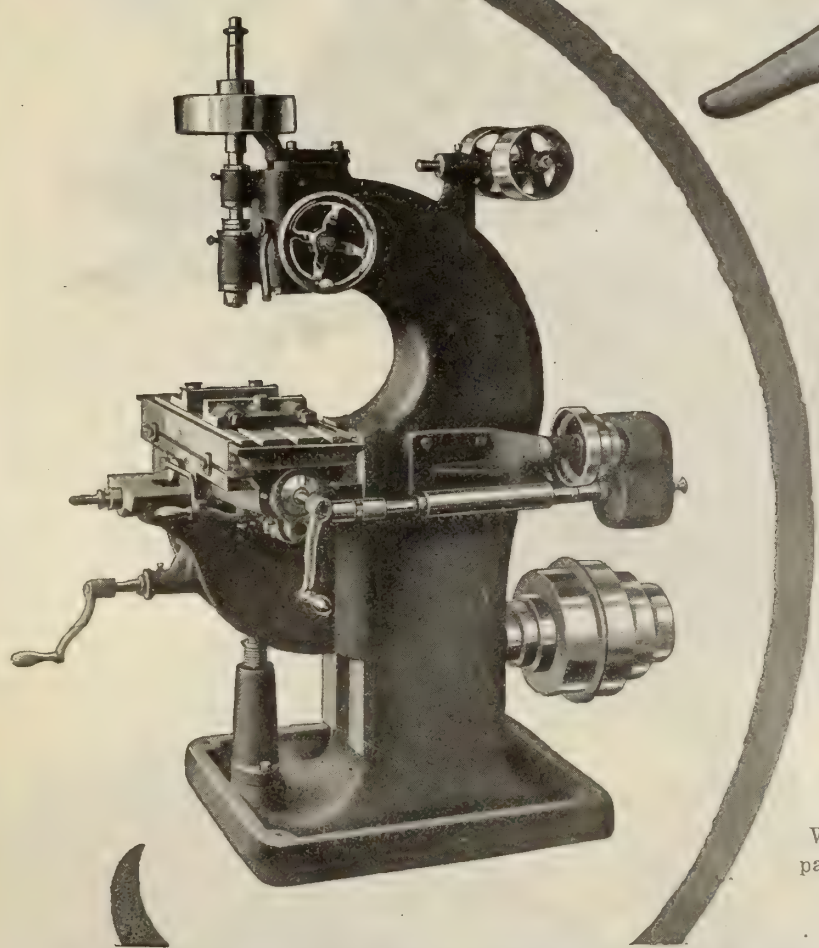
BRISTOL

Bristol Vertical Milling Machine

A Tool of Large Capacity



Ball Bearings are used at the most important points making it a free running tool, which, combined with its being a belt-driven machine, makes it capable of turning out work on which an extra smooth finish is desired.

The longitudinal table feed is controlled by the gear change box which gives six different feeds for each change of spindle speed. A stop to gauge with micrometer adjustment is used on the head to regulate the depth of cuts.

Learn all about its production capacity.

Write for bulletin giving fullest particulars.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

ASK US

If interested tear out this page and place with letters to be answered.

STEEL *for*

Every Commercial Purpose

We are the only company in Canada producing steel ingots by the "HARMET" Liquid Process, a process that makes these ingots vastly superior to the ordinary kind, improving the physical properties and reducing the waste of ingot.

We can supply forgings of all shapes and sizes made of ordinary or "HARMET" Fluid Compressed Open-Hearth Steel on the Shortest Notice.

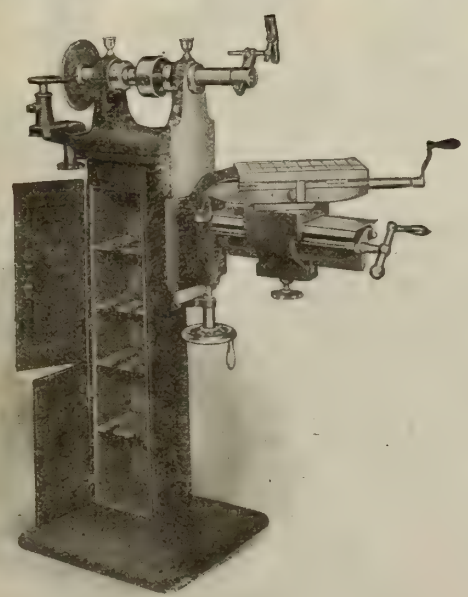
OBTAIN THE BEST RESULTS



GARVIN No. 3, Universal Cutter and Surface Grinder
Use Code—Banish

From Cutters and Tools Kept Sharp on

GARVIN No. 3 UNIVERSAL
CUTTER AND SURFACE GRINDERS

Simple Light Running Accurate

The spindle is hardened and ground and supported out close to the wheel by an extended bearing, and carefully protected from emery.

The knee and the yoke carried on the knee both have a large range of adjustment. On the knee yoke or carriage is mounted the swiveling table, which has a quick, sensitive movement by rack and pinion operated from end or side.

On this table is mounted the index head, and all the attachments are held in this head.

An outfit of emery wheels, mandrels, bushings, wrenches, etc., is supplied with the machine.

Machine is designed to keep its original factory accuracy.

CAPACITY: CUTTERS, 14″ x 6″; SURFACES, 9½″ x 6″

Mechanics Prefer DEFINITE Limits

Mechanics prefer to work between *definite* limits. They want to know *definitely* how large a dimension can be and how small. Ask them and see for yourself.

It may have been all right in the old days to tell a mechanic to "make it ¾ in. scant," "¾ in. full," or "¾ in. exactly," but such instructions are no good to-day.

The modern up-to-date mechanic wants *definite* limits, and when he has these, he can meet any reasonable demands for greater production.

It's the uncertainty of knowing just what is meant by "¾ in. full," "¾ in. scant," or "¾ in. exact," that holds back big production. It puts the whole proposition up to the individual judgment of each man—and no two men think exactly alike.

The way to get production is to find out how wide the limits can be—adjust Johansson Snap Gages to these limits—and keep the men supplied with the work. When this is done, the job gets comparatively easy—a mere matter of keeping somewhere between the high and low limits.

Johansson Snap Gages give the limits in such a definite manner that an unskilled blind man would know when his work was between them. There's no "reading" anything or adjusting anything. It's merely a little game of "Go" and "No Go."

Twenty-one Johansson Adjustable Snaps give every possible dimension from 0 in. to 12 in. New price list (No. 3) now ready.

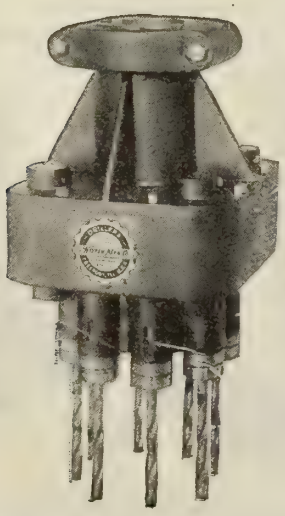
2 Minutes or 20?



This Is The Vital Question

Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

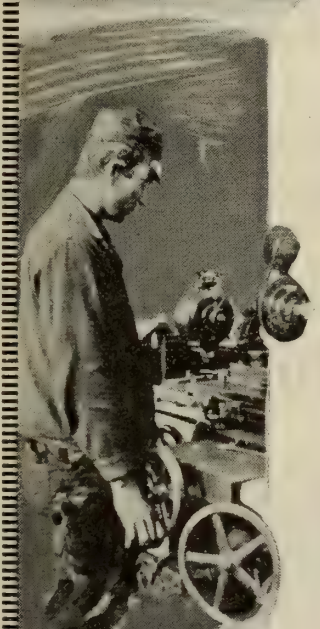
You Can Trust Your Tools to an Aloxite Wheel

WHEN you put a reamer, cutter, lathe tool, a drill or any tool on an Aloxite Wheel, you have a feeling of confidence.

You know you can trust your precious tools to an Aloxite Wheel because it cuts so clean, free and cool. There isn't any of that rasp and drag that creates undue heat to draw the temper.

And Aloxite Wheels hold their shape thus insuring accuracy.

They require comparatively little dressing and last long enough to be a real economy.



Aloxite Tool Grinding Wheels can be had in all standard shapes and sizes for all standard machines—or in any special shapes within the possibility of manufacture.

It is possible that our service department can make your grinding more profitable.

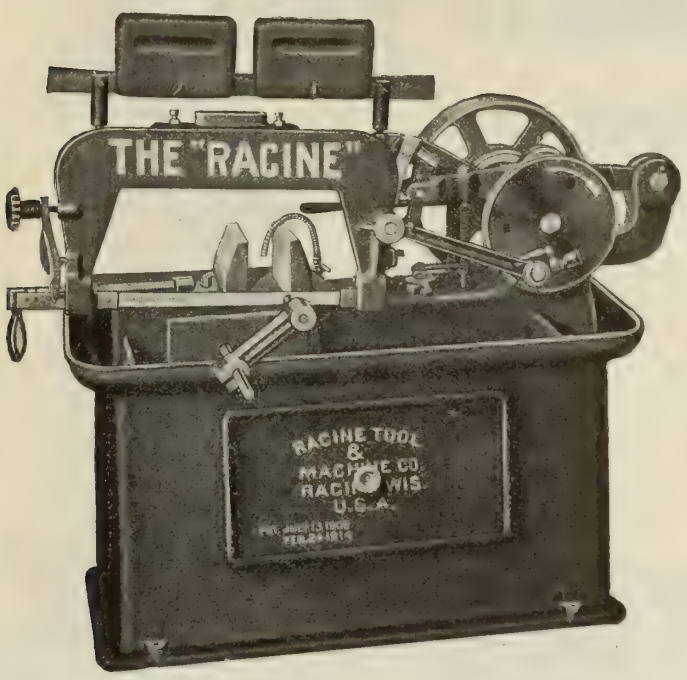
"THE RACINE"



HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

The machinist says:

"Sure I'm using them, the same as most of the men in the shop are doing. Some of the Starrett Tools in my kit, I bought when I was an apprentice.

"Y'see, it's like this. We got the habit when we were kids. We saw the older men, the ones that were doing the finer work, preferred Starrett Tools because they knew they were accurate, and we copied after 'em—just like our kids are doing today.

"How's that? No, I wouldn't go so far as to say that Starrett Tools by themselves will make a good machinist, but I'll say this—Starrett Tools will make it a lot easier for any machinist to do good work.

"Yes, I've got one of their 'Starrett Data Books for Machinists,' and believe me, it saves a lot of time and mistakes. If I want to know a decimal equivalent, a taper dimension, the speed of a milling cutter, or something about materials, I don't have to guess or ask — I just look in the book and find out. It set me back seventy-five cents at the hardware store, but it saved me a blame sight more than that in the first week."

Your Production---
Is It Up To Capacity?

A break in the production schedule through an unreliable hoist is a damper on production.

Your hoisting equipment is the "Go-Between," the connecting link that maintains uninterrupted routine and output.

Avoid breakdowns and unnecessary delays by installing a Wright Inner-Conveying System.

If your lifting requirements are constant throughout the day, there is only one hoist and that's the Wright Hoist.

If you lift only occasionally; or at great heights the Wright Hoist will do it quicker, safer than any you can install.

Why—because all the load sustaining parts are steel and malleable iron, mounted on good substantial roller bearings.

If you will buy your next hoist with the same care and investigation that you would buy any other important piece of equipment, your choice will be Wright.

Notes On Grinding

NORTON COMPANY, WORCESTER, MASS.

No. 65A

HAND GRINDING AND MACHINE GRINDING

ONE is likely to confuse hand grinding and machine grinding when thinking of some of the principles that govern the grinding action of a wheel. Now it is quite an important factor in the selection of the right kind of wheels for these two different methods of grinding, and so it seems necessary to point out some of the differences existing between machine grinding and hand grinding, so that these differences can be taken into consideration when grinding problems in either class come before our readers.

Of course, in both methods of grinding, that in which the work is held in the machine mechanically and passed before the wheel mechanically, and the class where the work is held in the hands of the operator and pressed against the wheel manually, the same general principles govern the results that are obtained —that is, the grain depth of cut, the radial depth of cut, the speed of wheel relative to these cuts, the kinds of material being ground, etc., all have their bearing on the resulting grinding wheel efficiency.

In both methods of grinding the construction of the machine plays an important part. The facts that the centres in the machine grinding method, the headstock, the table, the machine itself and all associated parts are heavy, rigid and substantial, and that they absorb vibration and permit of greater power being applied to the grinding wheel, carry equal weight in the hand grinding method where the work rest, upon which the work being ground is placed, is strong and rigid, offering a good support in case the work is carried up close to the cutting point of a wheel. There is no chance for vibration or cramping action if the spindles and bearings are generous in size and well made, and, therefore, better results are obtained.

There is one factor in hand grinding that does not allow for definite rules to be laid down, and does not permit of the same reasoning that can be applied to machine grinding, and that is the personal element that enters into this operation. Some men become very proficient in hand grinding. They know just how hard to bear on with the work in order to make the wheel cut freely and efficiently. They know just when it is necessary to dress the wheel, to break up the face or surface, in order to produce certain results. They know when the wheel is being burdened with more work than it can do, and they unconsciously and instinctively accommodate themselves to these conditions. They ease up on the depth of cut or pressure that they bring to bear between the wheel and the work, and pass the work over the face of the wheel quickly in order to accomplish certain results. They press or bear on to accomplish certain other results. There is really a considerable amount of art necessary in hand grinding, as well as in machine grinding, but always bear in mind that this personal equation is a factor which may introduce indifferent results or very satisfactory results when work, wheel and conditions may be the same, but two different men operate the machine at different times.

The tendency in hand grinding, as in machine grinding, is toward harder wheels. However, in either case, soft wheels are better producers

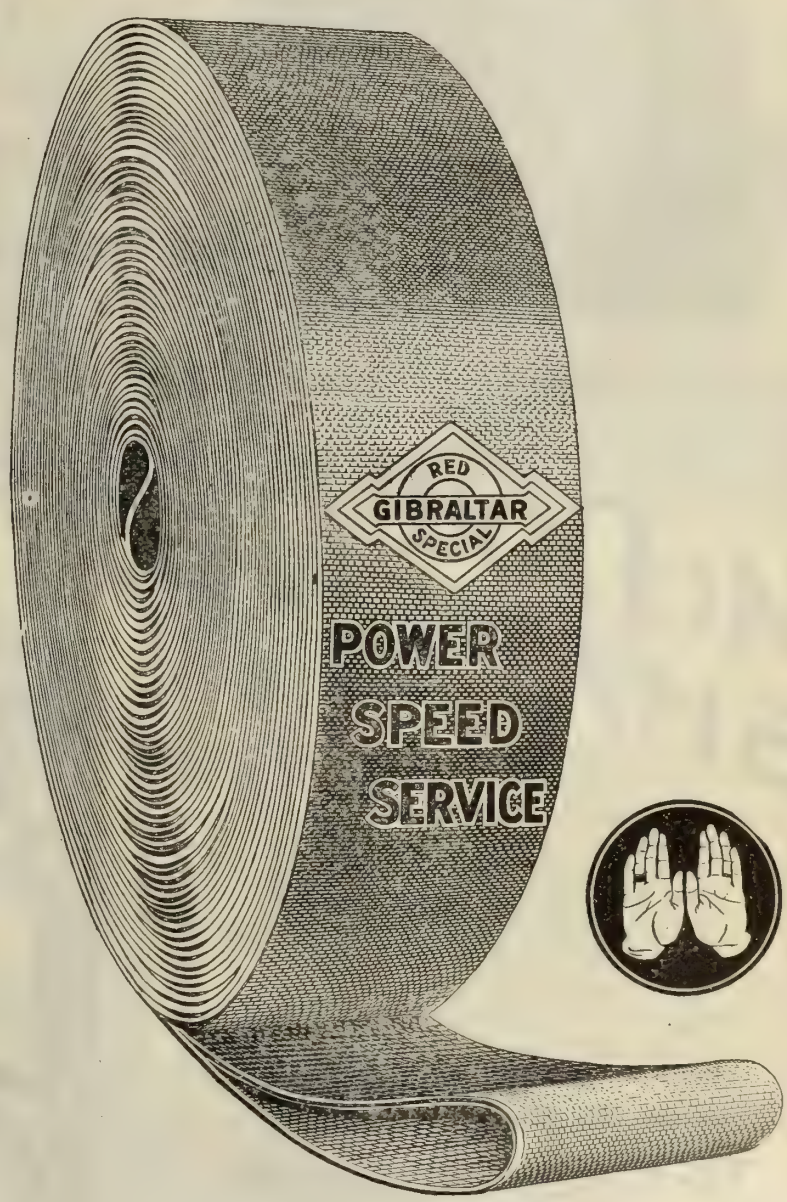
DUNLOP

"Gibraltar RedSpecial" Belting

"THE ORIGINAL RED FRICTIONED-SURFACE RUBBER BELTING"



WHEN it's a question of unusual achievements in Beltdom, "Gibraltar RedSpecial" stands supreme.

As an effective means of trimming down "overhead" it is known far and wide.

This Red Frictioned-Surface Belt has dominated the field since its inception.

Without variation this belt has lived up to the exacting standard of service set by us when it was first introduced to belt buyers.

Having been tested and tried to the limit in all manner of places—and by thousands of users throughout the country from the Atlantic to the Pacific—"Gibraltar RedSpecial" will also secure you against the uncertainties which surround the use of "just-as-good" brands.

The price may be higher than that of "ordinary" belts, but the service is long and satisfactory in the extreme, as a multitude of long-time users will gladly testify.

With the Dunlop Unreserved Guarantee which goes with every belt, you should have no hesitation in making your next order read "Gibraltar RedSpecial."

You know the Dunlop reputation for square-dealing, too.

Mark Your Products The "Matthews" Way

STEEL LETTERS AND FIGURES

In shops where the highest standards are maintained the stamping equipment is generally "Matthews Made."

Matthews Letters and Figures are hand made from carefully selected steel, heat treated for hardness, insuring long service under hard usage. They make deep, clean-cut impressions that outlast the product.

Mark your next order for steel lettering, dies or stamps—"Matthews Made."

The Blazing of New Industrial Trails

How the Bureau of Standards at Washington is Leading the Home Manufacturers to Fresh Fields—An Example to Canada and Canadians in General. Herein is a Challenge Worthy of Acceptance

By NAPIER MOORE

WITH the Canadian manufacturer bending all his efforts to get back to a pre-war basis now that official proclamation of peace is at hand, it is natural to suppose that he has an eye on his neighbor across the international border and is interested in what Uncle Sam has done by way of helping his manufacturers to compete with foreign trade and genius and break monopolies which continental Europeans held in certain industries before the war.

Probably no department of the American Government has done more for the manufacturer than the Bureau of Standards at Washington. Before the war the Bureau was investigating those fields of finer industry in which the foreigner apparently stood alone. The world conflict, with its consequent disruption of trade with Europe, served to emphasize still further the need for further effort in this direction. Data, painstakingly gathered during long processes of experiment by the experts of the Bureau were placed at the disposal of manufacturers, secrets were fathomed, and to-day, in more than one sphere, American factories are turning out products which five years ago were left to the European.

What Canada Has So Far Accomplished

In Canada, the Bureau of Standards of the Imperial Munitions Board did excellent work, but the exigencies of the situation practically confined its efforts to war work. And, in a broad manner of speaking, the Dominion Government's Bureau of Standards at Ottawa has been little more than a weights, measures, checking and testing office. Happily, Canada has realized the incalculable value of a bureau such as is found at Washington, and the recent appearance before an Ottawa Parliamentary committee of Dr. S. W. Stratton, Director of the American Bureau of Standards, indicates that in the near future the Dominion Bureau of Standards will be in a position to extend help and advice to the Canadian manufacturer that it has hitherto not been in a position to extend.

Through the courtesy of Mr. F. A. Fisher, the writer was recently enabled to make a thorough tour of the Washington Bureau of Standards, and to observe at close range the many activities in which its experts are engaged. To describe them all would necessitate the penning of a massive volume. They included, during the war, experiments with dyes and chemicals for industry and science; new methods for the manufacture of ammonia were tried; the recoil of great guns was tested, as were airplane wings, the latter in the monster wind tunnel. Airplane fabrics, varnishes and motors were tested; improvements in aerial photography were discovered. New recording instruments were designed and perfected. Optical glass was made for the first time on American soil, and the manufacture of delicate precision gages made an actuality.

And the good work done by the Bureau did not end with the war; its discoveries stand as a permanent aid to peaceful industry.

The Fostering of the Hoke Gages

In this day of interchangeability, when parts are manufactured at plants thousands of miles apart to be assembled at a central point, perhaps on this continent, perhaps abroad, the fostering of Major W. E. Hoke and his precision gages by the Bureau of Standards will, it is expected, be more than proved to have been a commendable step. For a dozen years and more Canadian and American manufacturers have been acquainted with the famous Johansson gages—those shiny, rectangular blocks of steel, capable of measuring to within one hundred thousandth of an inch, and even with still greater precision. What system of seasoning Johansson uses for his steel, what system of measurement he employs to obtain such miraculous results, nobody has yet ascertained. Until comparatively few months ago, the "Joe" blocks stood alone as a workable standard of measurement in American and Canadian factories. More than a thousand American shops swore by them.

Then along came Hoke. He told the Bureau of Standards he could make gages as good as or better than Johansson's gages, gages that would be accurate to a few millionths of an inch (the majority of which would prove accurate to within one millionth of an inch).

Director Stratton immediately gave Hoke the chance to make good his claim. Part of the Bureau's workshop was placed at the inventor's disposal. In three days he had set up his machinery and was turning out gages. Within one month he was manufacturing gages which no mechanical instrument could test, so fine was their degree of accuracy. To-day, apart from the Bureau of Standards, two private firms, one of them the Pratt & Whitney Company, of Hartford, Conn., have Hoke's secret, and the former is turning out quantities of gages for commercial use which are sent to Washington for careful checking up of their accuracy.

Has Hoke Beat Johannsson's Method?

Whether or not Major Hoke has discovered a method of retaining the constancy of steel as Johansson has done, time alone can tell. He claims he has. Certainly

no experiment is being spared to achieve this important end.

To back up his claims of greater accuracy, Hoke draws on science for the court of last resort in measurement known to the Bureau of Standards—the interferometer, or light wave method, capable of measuring to within millionths of an inch. Flatter and more parallel surfaces, obtained by his own lapping machine, and a system of working by "accumulative error," are the qualities that ensure a more perfect gage, Major Hoke asserts, and to the Major the writer was indebted for a morning of extraordinary interest, spent in wandering through his workshop and seeing, under his guidance, just "how it is done."

It was as a working tool that Hoke saw his gages, and the problem of equal accuracy for quantity production was one that he overcame by his application of the "accumulative error," or "symmetrical distribution of error" system. With ten of its one-inch blocks placed alongside of a standard Johansson ten-inch block, the variation of which has been checked by the Bureau's optical department to within a millionth of an inch, the aggregate error of the ten individual blocks at once becomes glaringly apparent under the delicate tests used. As an error of, say, three millionths of an inch is glaring when exposed by the cadmium light of the interferometer.

The demand, then, was to reduce the surfaces of the gages to an absolutely uniform degree of parallelism and flatness, and it is here that the Hoke lapping machine comes in. It is claimed that this machine works to a tolerance of three millionths of an inch, and the flatness of its plates is checked to within that leeway. By a carefully timed method of transposing the little cylindrical blocks diametrically at intervals during the lapping operation, combined with rotary movements which ensure every molecule of the steel's surface receiving uniform treatment, perfect equalization is arrived at. Naturally when gages are being turned out in quantities, during the process of manufacture each gage cannot be checked after each operation by the method of light ray measurement. The blocks are, therefore, at various stages of their manufacture comparatively checked with the highest working standard in the possession of the Bureau—that is, Johansson blocks, the accuracy and constancy of which have been most carefully established. With sufficient time to be assured of the constant quality of the steel of the American-made gages, it is likely that the domestic sets will be used as standards. Constancy, of course, is only provable by time, and years must elapse before the American gage makers can be positive that they have the constancy for which the Johansson gages have become famous, and on which, of course, ultimate accuracy depends.

The Use of the Interferometer

Hoke was not satisfied to prove his accuracy by the known variations of any standard, however. Only one method would satisfy him, and that was the court of last resort in measurement—the interferometer. True, the Bureau possessed its standard yard, checked carefully against international metre in Paris, but even the international metre rod is not perfect. It is susceptible to changes of temperature, even as are gage blocks, be the change so slight as to be incalculable by human means. Twenty years ago, however, Professor Albert A. Michelson, of Chicago, went to Paris, and, taking the international metre as the recognized world standard, calculated the number of light waves it equalled. And it is to the standard of the light wave, easily applicable by means of an improved and simplified interferometer devised for the Bureau of Standards by C. G. Peters, that Major Hoke works. He uses cadmium rays, 24,098 waves of which equal one inch.

The method of measurement by light interference has received lengthy treatment in several American technical magazines of late, and it would serve no purpose to repeat details here. Sufficient to say that it has apparently established the superiority of "end" measurement over "line" measurement, under the latter of which even the finest of fine scratches on a measuring rod possesses thickness and so renders absolutely perfect comparison impossible.

The writer witnessed Major Hoke test some of his gages by this light method, detecting errors in flatness of millionths of an inch. The difference in flatness caused by a finger print became as a glaring error in terms of millionths.

To such a standard of accuracy does Hoke work. To what standard Johansson works is a carefully preserved secret. That he does not depend on the interferometer is known, however. He even claims that light waves are inaccurate, and that his gages are of greater accuracy because of more dependable methods that he has worked out. In effect he claims that the new American-made gages cannot be as accurate as his because they are made to a standard which, while regarded as the last word in measurement by the Bureau of Standards, is one which his investigations have shown him is not absolutely dependable. He has yet to prove it. Should he be able to—and all things are possible—science would receive almost as big a jolt as it would were it demonstrated that the world is flat. It is said that Johansson has given much attention to the study of light waves and may soon announce some of his findings.

Real Competition With the Foreign Product

Meanwhile, American-made gages have made possible a real competition with the foreign product.

Major Hoke is still experimenting with the Bureau of Standards. He has applied his discovery to the production of precision ball bearings, and is now working on a new method for the seasoning of his steel. He recognizes that the value of all precision products lies largely in so seasoning steel that it will "stay put." The steel from which the highly accurate Johansson blocks are made has been analyzed repeatedly, and Major Hoke believes he is on the road toward discovering the valuable secrets of the Swedish steel workers.

The Manufacture of Optical Glass

One of the most striking successes achieved by the Bureau of Standards has been in the manufacture of optical glass. Previous to the outbreak of the war, practically all of the optical glass used in America came from a few German, French and English makers. At that time the total annual world demand amounted to but a hundred or two tons. Some secret processes were involved, and no American firm had cared to go to the expense necessary to any investigation upon which manufacture could be based. Therefore, absolutely dependent as she was on these European countries for her optical glass, America was faced with a somewhat grave problem when her supply was cut off by the opening of hostilities.

It was then that the Bureau of Standards came to the rescue. Its experts applied themselves to research and experiment with commendable enthusiasm, and in th winter of 1914 experimental furnaces and auxiliary apparatus was set up in the Bureau's Pittsburgh plant. Several manufacturers were also given the benefit of the data arrived at by the Bureau, and during the following two years pioneer work of great value was done.

The making of optical glass is no easy matter. The pots in which the ingredients, carefully selected as regards purity, are melted presented a knotty problem. Melting glass must be thoroughly stirred to make it as homogeneous as possible. The stirring rod itself, and even a small portion of the inner surface of the pot will dissolve in the glass, and naturally these pots must be made of a substance which will not color or stain the glass. One of the big problems, therefore, which confronted the Bureau was the finding of a suitable refractory material for the pots. After much careful experimenting, the waste bisque of whiteware potteries was decided on, and while formerly it took a long time to

make a pot by hand, a casting method was perfected which cut down the time to three weeks.

In process of manufacture, of course, the melted ingredients of the glass undergo a long and perfect cooling, which in some cases extends to months. Then the pot is broken from around the glass. The utmost care cannot prevent the contamination of that surface of the glass that has been in contact with the surface of the pot, and accordingly sometimes only as much as 20 per cent. of the glass block is available for use.

The Bureau to-day is still experimenting on pots that will give even better results.

However, when the United States entered the war, considerable progress had been made. The Bausch and Lomb Company, Keuffel and Esser, the Pittsburgh Plate Glass Company, and the Spencer Lens Company were among the companies engaged in turning out considerable quantities of excellent glass, while the Bureau in its own plant was manufacturing glass equal to any made in Europe. Then came the demand for increased production to satisfy the immediate needs of the army and navy for optical glass for binoculars, gun-sights, range finders, tank sights, bore-sighting devices, periscopes, airplane cameras, bombing sights, and so on. The Bureau of Standards at once enlarged its Pittsburgh plant, and the manufacturers provided added facilities, receiving invaluable advice from the Bureau experts and those provided by the Geophysical Laboratory of the Carnegie Institution. The total production quickly reached twenty tons per month, and at the time the armistice was signed, the Bureau plant at Pittsburgh was alone turning out two tons per month.

To-day, highly profitable experiments are being continued in the extensive laboratories of the Bureau at Washington. The samples of optical glass on view there speak for themselves. America is making as good optical glass as that of any foreign firm. But there is at present little profit in the industry, so in that respect it loses its attractiveness for the private manufacturer. One or two firms, which, actuated by a high patriotic impulse, manufactured the glass during the war, have ceased to make it. At least two firms, however, will continue its manufacture. The optical glass industry will never be permitted to slide back to a foreign monopoly. The only problem to be solved is that of cheaper production here to compete with foreign concerns on a large commercial scale. This the Bureau will not be long in solving.

The Manufacture of Nautical Clocks

Yet another phase of the Bureau's activity concerns ships' timepieces, practically all of which, before the war, came from England. The ravages of the submarine war and the necessity of filling her own wants, naturally cut off America's supply of nautical clocks, and, when the Emergency Fleet Corporation began to turn out ships by the score, the need for reliable timepieces was great.

Once again the Bureau of Standards jumped into the breech. Several firms were given the benefit of its expert advice, and they were quick to enter into the manufacture of finely-adjusted, large-size watches, which, set in regular gimbals, have taken the place of the familiar ship's clock. Row after row of clocks—thousands of them—may be seen at the Bureau, all being checked with a degree of accuracy which speaks volumes for the fineness of the work put into them. America will never again be dependent on England for her ships' clocks, or, as they are now, ships' watches.

It will thus be seen that the war awakened the American manufacturer to a realization of what a Bureau of Standards could accomplish. Its researches have not ended with the conclusion of hostilities. Door after door in the commercial and industrial world will be opened by the home manufacturer with keys supplied by the Bureau of Standards at Washington, D.C.

Canadian Machinery Drafting Course--Part II

In This Second Portion We Go Still Further Into the Use of the Drawing Instruments, and Discuss the Various Type of Lines as Adopted in General Drafting Practice

By J. H. MOORE, Associate Editor Canadian Machinery

BEFORE commencing on the second part of this course, how about the first instalment? Did you study it up and derive any benefit from the same? What is equally important is this: have you sent us in a sample of your work? Remember the three prizes each issue, so get busy, if you have so far hesitated at sending your work along, for it might be your plate that will land a prize.

In Part 1 we touched on the very simple uses of the drawing board, T-square, and triangles. Plate No. 1 was simply a test to see if instructions had been followed, so now let us go still further into the various other instruments, as required in the art of mechanical drawing.

The Scale

Fig. 1 illustrates a very popular type of scale as used in drafting work. These scales are usually constructed of boxwood, and are made in a triangular section as shown. Usually they are graduated for a distance of 12 inches. The type illustrated has six surfaces for different graduations, and the scales are so arranged that the drawings may be made in any proportion to the actual size. For general mechanical work the common divisions are multiples of two, thus drawings are made full size, ½ size, ¼ size, ⅛ size, 1-16 size, etc., etc. Should a drawing be half size, of course 6 inches would then equal 1 foot, while if ⅛ scale is desired, 1½ inches equals 1 foot. The scale is provided with all these necessary graduations, and the student is advised to study his scale and becomes acquainted with the graduations of his scales and how to use them, for later on in the course this will become a necessity.

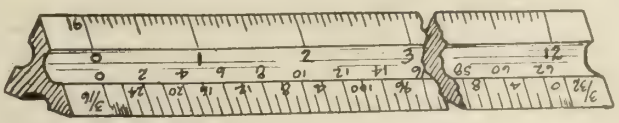

FIG. 1—GENERAL VIEW OF TRIANGULAR SCALE.

Another very handy scale is the flat type, with beveled edge, but as the divisions on these scales are similar to the triangular type we need not discuss the scales question further. For the present, all drawings will be made full size, so students have ample time to familiarize themselves with the use of their scale.

The Protractor

Fig. 2 illustrates the instrument known as a protractor. This tool is used for laying off and measuring angles and is usually made of steel, brass, celluloid, or sometimes paper, but the latter is not to be recommended, as it soon becomes worn and is not to be depended upon for accuracy. For general use in this course, either of the first three

stated will do, with the celluloid the favorite. If made of metal the instrument is cut away as shown in sketch, in order to allow the worker to see his drawing, while if made of celluloid the piece is solid, for the instrument is transparent, a decided advantage over the metal type. In all cases, however, the outer edge is divided into degrees, and tenths of degrees. Perhaps it would be best to sort of jack up readers' minds to the fact that there are 360 degrees in a complete circle, therefore 180 degrees to a half circle. The protractor is laid out in such a manner as to read from 0 to 90 degrees, then reverse, while in some cases both values are stamped on the instrument, as for example, opposite 70 degrees would be also stamped 110, for one would be the component of the other. To prove this in a simple manner for the reader's benefit, let us first take the 70 degree mark. This is 20 degrees less than 90, so in placing the component we must first take the 90 plus the 20, making 110, or the other marking.

To lay off a required angle, use a very hard and carefully sharpened pencil. Place the protractor so that the two zero marks are on the given line and the centre point marked A on sketch is at the point through which the desired

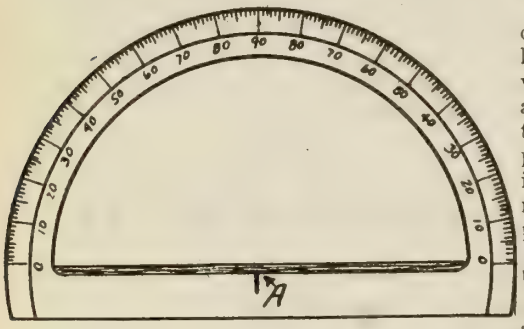

FIG 2

FIG. 2—ONE STYLE OF PROTRACTOR.

line is to be drawn. Mark a point at the degree desired, mark your centre point and draw your line, which will then be at the desired angle from the horizontal.

Irregular Curve

Perhaps as convenient a tool as the draftsman uses is that known as an irregular curve. This peculiar shaped instrument is sometimes called a French curve, but is generally known as an irregular curve. It is used for drawing curves other than arcs of a circle, with either pen or pencil. These tools are made of wood, hard rubber or celluloid, and once more the celluloid is the better owing to its transparency. Any curve drawn by such means is usually termed a freehand curve.

At all times try and get your curve to pass through at least three dots, or points as they are usually called, of the line desired, for a much smoother curved line will be the result. Usually it is good practice to first pencil the line in lightly, then ink it over. In inking in, it is most important that the blades of the pen be kept tangent with the curve, otherwise there is a tendency to blot the work. Later on in the course students will find they require to use this tool, but for the present, at least, they will not be called upon to use it.

Compass, Dividers and Pen

Fig. 4 illustrates the instruments more used than any others, with, perhaps, the

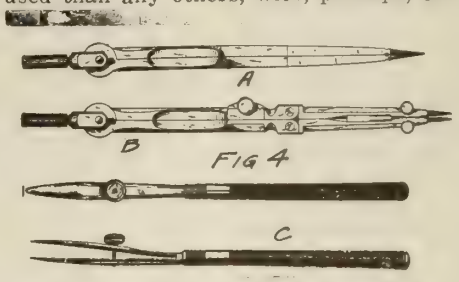

FIG 4

FIG. 4—SOME OF THE VARIOUS INSTRUMENTS USED.

exception of the T-square. At A is shown the dividers, used in laying off distances on the drawing, either from the scale or other parts of the drawing. They are also used to divide a line into equal parts. In fact their use becomes more and more general as the student becomes accustomed to them.

B illustrates the compass, used in drawing circles and arcs of circles. One leg of these compasses has, as readers will notice, a screw which loosens and allows one leg, usually the pencil point, to come out from the lower half, and the pen point or extra length bar to go in its place. By this means the one main body can be used as a pencil compass, or pen compass, simply by interchanging, while by adding the extra length bar, you enlarge the capacity of the instrument, for this bar has also a hole in it to accommodate either the pencil or the pen. From constant practice with this instrument comes a knowledge far better than written instruction can ever give the student. About as easy a method of holding the compass is this. Never use both hands, but learn to handle the instruments easily by one hand.

The pen as shown at C illustrates both views clearly, first as it looks from the top, and secondly as it appears from the side when open. This pen is used for drawing straight lines, or curves that are not arcs of circles. Commonly it is simply termed the ruling pen. The distance between the pen points is adjustable by means of a little thumbscrew as shown. The blades are given a slight curvature, so that there will be a cavity for ink, even when the pen points are very close together. The pen should not be dipped in the ink, but should be filled by means of the quill, which forms a part of the cork on practically all India ink bottles. Do not attempt to place too much ink in the pen at once, about ¼ to ⅜ in. will be found sufficient. Upon finishing your work always take a cloth and wipe carefully both blades of the pen, as all liquid inks corrode the blades if allowed to dry, and no good work can be done with a poorly-kept pen, so students will do well to remember this point throughout the course.

In using the pen be sure that both blades bear evenly on the paper, in order that the resulting line be smooth and even. Study the chart at Fig. 6. A and B illustrate a common danger, namely, first too great a slope outward, and second too great a slope inward. Either one is wrong, and must be avoided if good work is to be obtained. C illustrates the correct method, namely, keep your pen blades as vertical as possible. At Fig. 7 is shown another view of using the pen, and students cannot do better than to study carefully these two views, and practise inking until a good, straight, clear line can always be obtained. Don't be hasty to blame the pen, ink or paper; be sure it's not the operator. A little time spent in this practice work will be time well spent. The other remaining instruments are the bow pencil, dividers, and pen, so called because of their bow construction. These tools are used for smaller and finer work, and are especially adapted for circles having a radius of less than ¾ inch, but their use and manner of using are practically the same. Fig. 8 illustrates a typical set of good quality instruments, together with case. Students need not purchase such an elaborate set as shown unless they so desire. For general work in this course a cheaper set will do equally as well. The only reason for showing

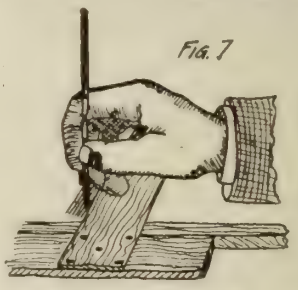

FIG. 7.—THE CORRECT WAY TO HOLD THE PEN.

such a set is to illustrate the class of tools used in the regular drafting business.

Some Triangle Problems

Now that we have gone into the various instruments as used, let us go a little further into the use of the triangles, as started in Part 1. We have so far made 45, 60 and 30 degree lines with these tools, but they have a much wider use, as illustrated in Figs. 9 to 14. Let us consider them in sequence.

Fig. 9 illustrates a very common use, namely, drawing parallel lines at an angle to the horizontal, by means of the T-square and triangle. Fig. 10 illustrates the use of triangles only, and shows the method of drawing a line parallel to a given line. First place triangle A with one edge coinciding with the given line B C. Now take triangle D and place one of its edges in contact with the bottom edge of triangle A as shown. Hold triangle D firmly with the left hand and slide triangle A to the right or left as desired, until you reach the point through which you wish to draw the line E F.

Fig. 11 shows clearly that by combining the 45 and 60-30 triangles with T-square, you can procure angles of 15 or 75 degrees.

Fig. 12 illustrates the drawing of a rectangle by means of triangle and T-square. First draw, by means of T-square, lines A, B, C and D. Now use your triangle and draw vertical lines CA and BD, when rectangle will be complete.

Fig. 13 illustrates another method of drawing a rectangle by means of triangles only. Place your 60-30 degree triangle A as shown at whatever angle you desire, then place your 45 degree triangle B on top of same in manner shown. In the dotted position you can draw in the short sides, while in the heavy position you can finish up the longer sides.

Fig. 14 illustrates the method of drawing perpendicular lines on given lines, by means of T-square and triangles. Either combination can be used and both are used for illustrative purposes. From these six illustrations students can get some idea of the T-square and triangle possibilities. By constant practice they will find that these tools become more and more useful as time goes on.

Lines

So far we have only discussed full lines, but now let us go into the matter deeper and find out just what type of lines are commonly used in drawing practice. Refer to Fig. 15 and follow the lines as they are marked, A, B, etc. A represents what is known as the full line, and is the most common of all. B illustrates two different types of dimension lines, each of which is permissible. C shows the dotted or hidden line, which is used to designate a line hidden from view. D is known as a construction line, and is used in various places, such as joining together two views, or projecting across from one view to another, which gives them their name, construction lines, but the name is all we wish you to get at present, for its application will be fully explained later in the series. E illustrates the centre line, which resembles the construction line, but it will be noticed that two dots in place of one go between each long dash. This line and its uses will be discussed fully later. F shows what is known as a border line. This line is similar to the full line, but twice its thickness. We only touch on this line subject in order to give students practice in the following plate, on the various lines. We wish you to memorize the names, so that when the discussion on their uses comes later, it will be that much easier for students to follow.

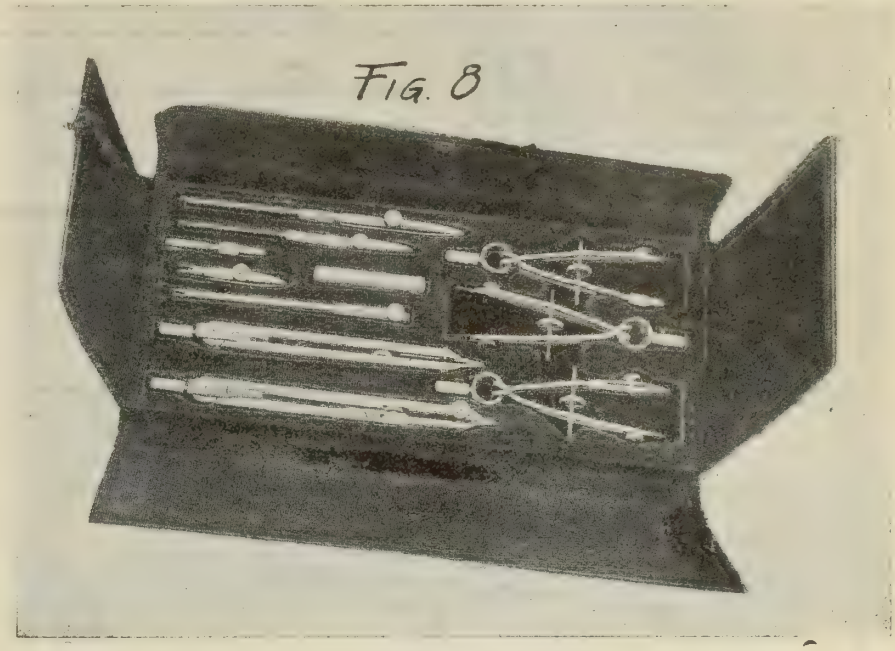

FIG. 8—TYPICAL SET OF INSTRUMENTS

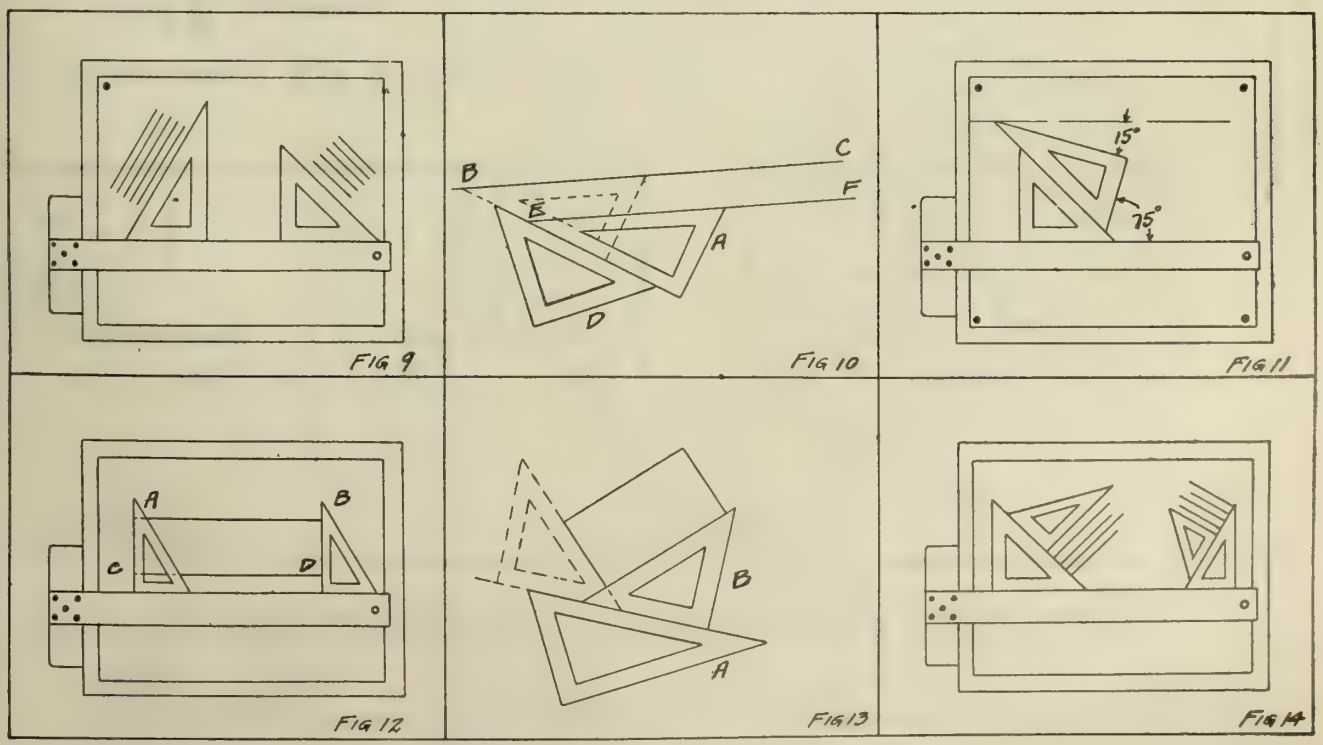
Now since we have covered so much ground in this second part let us close it by instructions for plate No. 2.

Draw border lines as before, 9x13, and trimming lines, 9½x13½, and divide sheet into four sections. Note dimensions and work to these. Study the plate carefully, for all the various lines spoken of in this article are worked in on the practice plate. Draw everything to di-



VARIOUS USES FOR THE T-SQUARE AND TRIANGLE

mensions. In drawing the dotted lines, make each dot about 1-16 in. long and allow 1-16 in. space between each dot. For the other type of lines study the plate. First draw the lines lightly in pencil, then ink in afterwards. Higgins' black waterproof India ink is as good as any. Be careful not to make your pencil line too heavy, otherwise your inked lines will not be as clear. After completing the plate, write on a separate sheet the style of lines marked A, B, C, D, E, F, at Fig. 1 on plate, also lines G, H, I, J, K, on Fig. 2, also on plate. The little f on Fig. 3 denotes that surfaces are finished but the only reason we placed them on drawing is to familiarize students with their use, for later this point will be fully gone into.

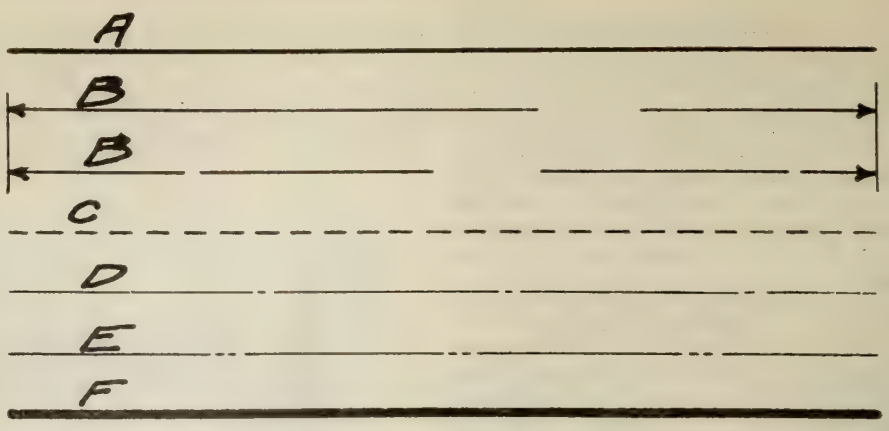


FIG. 15—VARIOUS STYLE LINES AS USUALLY ADOPTED.

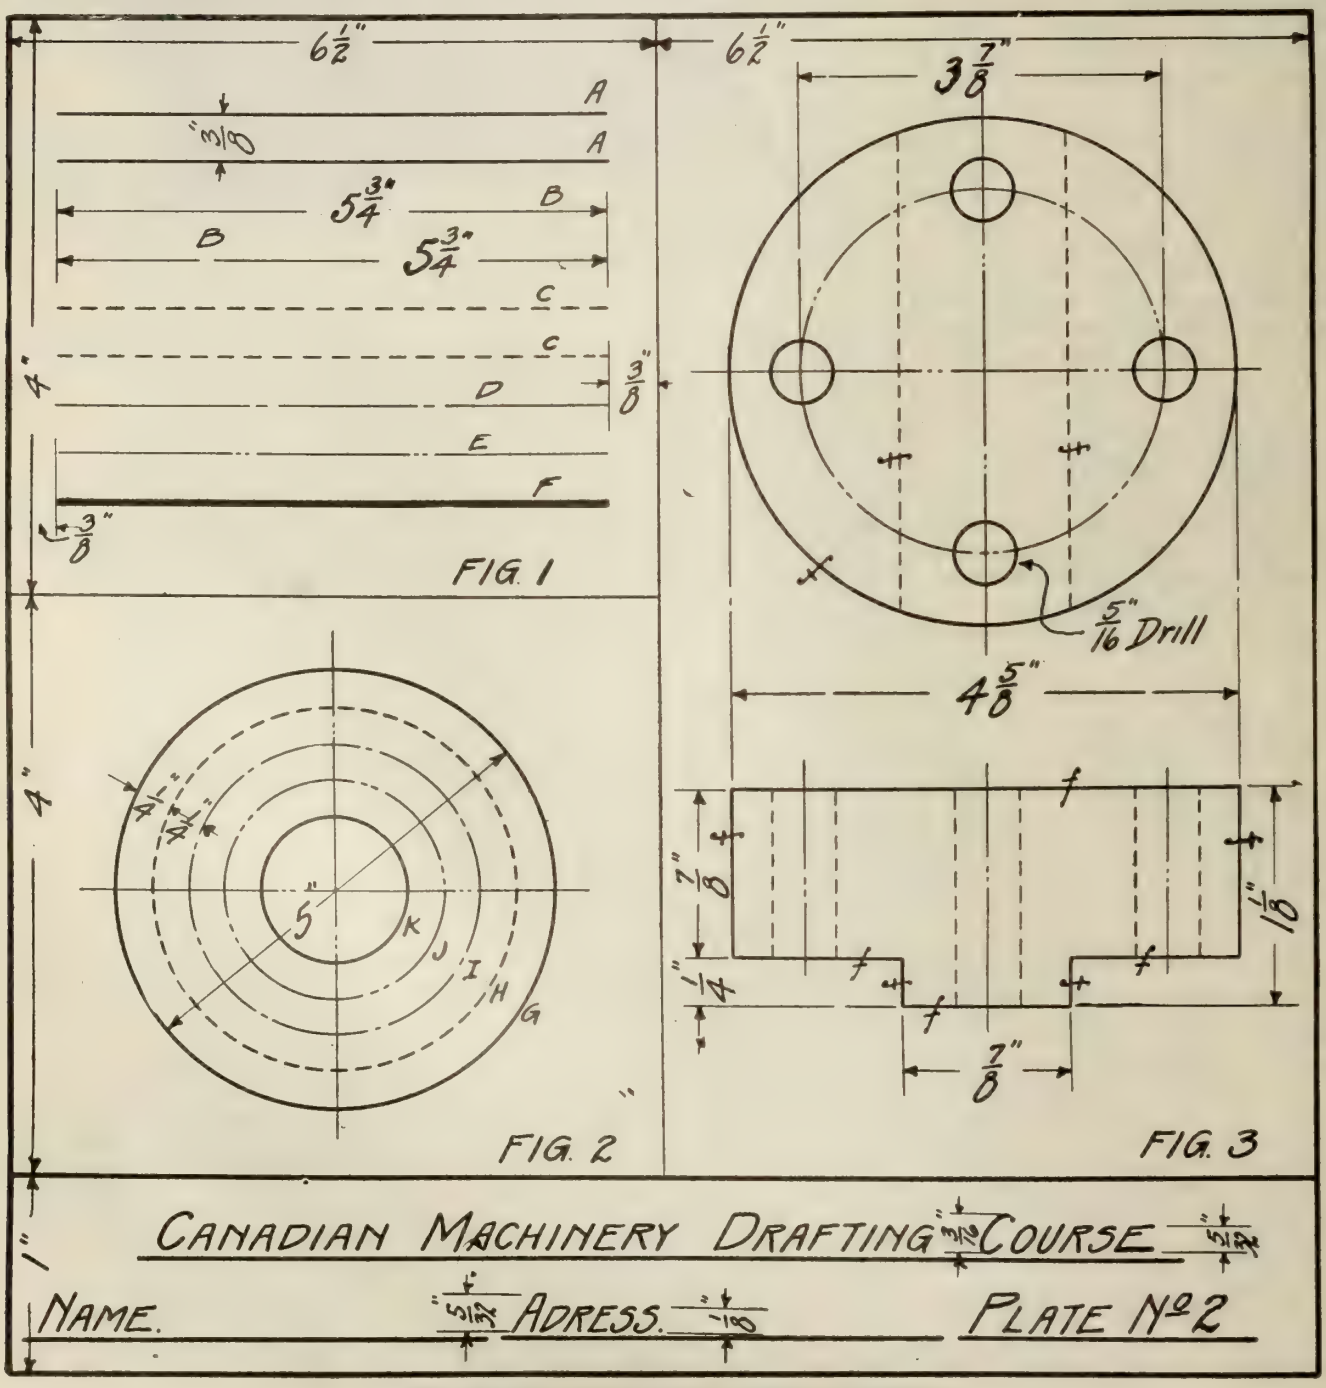
Above all take care to make your plate as neat as possible. Remember we have three scales for the three best plates received. These scales retail at $1.25, so stick to it and send your work a'ong, so that you are in shape to tackle the next section and plate No. 3 in the next issue.

(See coupon to fill in on page 368)



LET US HAVE YOUR PLATE AS SOON AS POSSIBLE.

Is it Worth While Reading Technical Books

A Short Mythical Tale, Which All Should Read Regarding the Writer's Views on the Above Subject. Read, Digest, Then Act Upon, Would be Our Advice on the Matter

By I. M. TELLINGYOU

TO enter a subject of such a nature, we should, to be fair, show the two sides of the case, so for illustrative purposes, suppose we concoct two stories, which, while all imaginary, happen in a similar way every day in our daily grind.

We will first take the case of—well, let's say John Blank. We see him go through school fairly well. He never gives undue worry to his lessons. If they come all right—very well, then it's all jake as we would say. On the other hand, if he fails—well, he should worry.

John drifts along in this manner with no definite purpose in life, until time comes to leave school and go to work. "Now John," says his father, "what would you like to start at?" Ten chances to one John says, "I don't know, Dad, I never thought very much about it, etc., etc."

The upshot in quite a number of cases is that John either starts a trade which he does not like, or is not suited for, having no special preparation for the same, or on the other hand he does not start in a trade at all, but takes up some occupation easy to do (that is as far as brain power is concerned), and so he continues to drift.

Let us leave John for a while at this stage, and spend a little while studying Tom, his brother, who, by the way, is a year younger than John. Tom always was a joke in John's eyes, for when John would be out playing ball, or off to the show, Tom, like a ninny (using John's expression) stayed at home and read.

"What did he read?" you might be tempted to ask, when John would sneer and say, "Oh, some dry technical stuff, I don't know what it's all about, but Tom claims it will make him worth more money some day. Of course that's all bosh," was usually John's final thrust.

However, to continue with Tom. He goes to the same school as his brother, but passes in every class, owing to his earnest attention to lessons, combined with home study. Strange to say, Tom passes his classes faster than his older brother. And, when leaving school, is at the highest grade he can go in this type of day school.

In the meantime Tom has been reading "dry technical stuff" (as John expressed it) with a definite aim in view. He has also been going to manual training, and practically made up his mind what he wants to be.

His father does not ever have to ask him, "Well, Tom, when do you think you'll start in work?" for they have had many a little chat together on the subject, and it is all settled. Tom goes to work with the same earnest spirit in which he tackled his school, and results begin to show themselves as the years go on.

To get back to John. He makes enough to live on, and have a fairly good time. Of course he saves nothing, but then "you can't save and spend," as he puts it.

Tom has finished his apprenticeship, and gets at last some real money, where before he was the laughing-stock of his brother for the small salary he was receiving. The night that he comes home with a tradesman's pay is a happy one for Tom, but not so hilarious a time for John. Tom's salary now has John's wage looking like thirty cents, and yet the end is not in sight.

Years go on, John asks for a raise and does not get it. Tom never asks for increases, yet seems to get them periodically. He is accused of standing in with the foreman, etc., etc., but he merely smiles and keeps on reading technical books in his spare time.

One day the foreman gets sick, and Tom takes his place. He tells the story without boast when he comes home. John pooh pooh's the idea, yet underneath it all he knows it is the truth.

He gets his brother up in the room alone, and starts in this manner: "Say, Tom, I don't believe those books helped you a darn bit—but are they hard to read?" Tom sees his opoprtunity, and realizes his brother is waking up at last, so he gives him a good strong lecture.

To be brief, we will pass over quite a few years. Tom is now superintendent, but Jack is also coming strong. The good stuff was in him, all it needed was bringing out, so you see the idea and moral of my little mythical tale is this: "That it's never too late to start in and learn. You often get to an age when going to school is out of the question—but you have always got a school in your home, if you pick out real up-to-the-minute technical books."

As one fellow who knows what he is talking about remarked to the writer:

"The educated man will always command the respect of the community in which he resides and has been of the greatest service in the development of modern civilization. It was not so far back in history when education was difficult to obtain, and only the wealthy could acquire knowledge. The worker could secure an education only under almost insurmountable difficulties. Not only were the schools few and inaccessible to those who did not live in large communities, but, owing to limited mail service and unsuitable text books, the average citizen found it difficult to acquire anything but a limited knowledge of the three 'Rs,' reading, 'riting, and 'rithmetic, as the old-timers used to say, in the country or city school.

"To-day there is no excuse for any reasonably intelligent person remaining ignorant of any art or science in which he or she is interested. Numerous text books, written by experts, deal with technical subjects in simple, understandable English, and some treat of real scientific matters without using highe mathematics or 'dead' languages.

"If one compares the semi-technical or mechanical book of to-day with those published even a decade ago, a great improvement in the character of material, quality and number of illustrations and logical arrangement of subject matter will be evident. In modern books dealing with mechanics, simplicity of exposition and clarity of reasoning is aimed for rather than strictly literary merit as exemplified by complex phrases. The semi-technical or home study books are the most difficult of any to write, and there are comparatively few writers who can simplify technical facts without sacrifice of accuracy of description. Compared to stories and novels, technical and mechanical books are difficult to prepare. The former are usually the result of an active imagination, and are short-lived; the latter call for much study and research on the part of the writer and courage on the part of the publisher, because of the expense involved in their production and slower sale. Hundreds of costly special drawings and photographs must be used to illustrate the text, whereas the story books seldom have more than a dozen or so.

"Publishing good and really useful mechanical and technical text books calls for experience that can only come through a long and well-established business, because it takes time to gauge the public demand and prepare books to meet it. Naturally, the best books are those produced by the oldest houses, because they command the services of the best editors and writers, and can produce books of the greatest value to the mechanic or student desiring instruction.

"It is not generally known that any mechanic can secure a comprehensive review of the theory and practice of his trade, either in its broad entirety or in any of its specialized phases for about the price of the average theatre ticket, and a week's pay will buy a set of mechanical books that cost over a quarter of a million dollars to prepare and publish, and that embody the elements of a complete three or four years' college course, boiled down to solid facts and presented in interesting, understandable language.

"The ambitious man of to-day is seeking more education, not only in his own line but those related to it. Those who

learn more invariably earn more. A man who has the courage to study good books after working hours to increase his knowledge possesses the main quality to secure success. He is the one who is able to seize an opportunity when it presents itself, and home study is what makes the apprentice or journeyman of to-day the shop foreman, manager, or owner of to-morrow. One must read consistently to keep up with the marked progress in the mechanical field. Not only must he keep posted on current progress of his trade by studying trade papers, but he should have good books of reference constantly available to know what has been done and why, as well as the possible developments of the future."

The writer personally agrees with every word of this gentleman's opinion regarding technical books, and can only add: Study first the company from which you purchase your material. Make sure they are in a position to supply you with up-to-date material in order to keep you up-to-date.

"Where shall I write to, and what shall I write for?" some readers might inquire. Well, that is a difficult question to answer. We first of all would not state any particular house to write to, but leave that to your own discretion, and cannot advise you exactly what book to write for, as we do not know the subject which you wish a book upon. We can, however, advise you to write for catalogues, and pick out the subjects you wish to study.

This is the common sense way of doing things. First make up your mind what you want to study. Next pick from catalogues the books you want, and last but not least, when you get them, see that you study them closely and do both the books and yourself justice.

For readers' benefit, and through the courtesy of the Norman W. Henley Publishing Co., 2, 4, 6 West 45th Street, New York, we are able to conclude this article with a review on eight books, on eight entirely different subjects published by this firm. In this way we no doubt will appeal to all readers' taste in at least one of these books. Our reviews cannot be of undue length owing to lack of space, but we will give readers at least a list of contents, together with our views on these books.

First let us start with a book entitled,

"Compressed Air And Its Applications"
By G. D. Hiscox, M.E.

This book has 665 pages, 35 chapters, over 500 illustrations, and could be well called an encyclopedia on the subject of compressed air. It is written by a man who is an expert in his line. He has dealt with the subject very thoroughly. The physical properties of air; motion of air and its force; pressures below atmospheric; the flow of air under pressure from orifices into the atmosphere; the power of the wind; isotherms; compression and expansion of air; thermodynamics; adiabatic compression and expansion; the compressed air indicator card; actual work of compressor. Multi stage air compression; expansion of compressed air, and the work of the motor; transmission of power by compressed air; compressed air reheating and its work; the compressed air motor; efficiency of air compressors at high altitudes; air compressors; compressed air in mining and quarrying; pneumatic tools in all phases; compressed air in railway service; pneumatic work; pneumatic tube transmission; compressed air in warfare; compressed air work; refrigeration; the hygiene of compressed air; later developments in air work, and last but not least, a list of patents from 1875 to July 1, 1908. Readers can readily see that this book is a detailed study of the subject, and well worth the $6 which is the publisher's price. Anyone interested in compressed air can safely depend on this book.

"Punches, Dies and Tools, For Manufacturing in Presses"
By J. V. Woodworth, M.E.

Here is a book for all practical men interested in the working of sheet metal. It consists of 483 pages, is well illustrated with sketches, etc., and sells at the publisher's price of $4.50. The subjects of die making; punch making; die sinking; sheet metal working and making of special tools; devices and mechanical combinations for piercing, punching, cutting, bending, forming, drawing, compressing, embossing, forging, and assembling metal parts. It also includes articles of other materials in various machine tools. The making of cartridge shells; wire and bar steel drawing dies; tools for paint and chemical tablets; pens; pins and needles; jewelry; eye glass; spoon and fork making dies are also included. Subpress dies for watches, and clock dies also form part of this book, together with drop dies of various descriptions. In other words an ideal book for those interested in die work.

Books on Gearing

To those interested in gearing, we can safely recommend the following gear change devices by D. E. Perrizo, M.E. This book sells for $1.25, and describes and illustrates the development of the screw-cutting lathe, and the United States patents upon the methods for obtaining various pitches of screw threads. The engravings are made from the records of the United States Patent Office. The book contains 101 pages, and covers the subject very thoroughly. This book is especially adapted for draftsmen, designers, would-be inventors, in fact anyone interested in gearing.

The next gear book to be mentioned is "Bevel Gear Tables," by D. A. G. Engstrom. This book of 66 pages also sells at $1.25, and contains a collection of tables with necessary explanation to enable anyone to figure bevel gears without the use of trigonometry. Anyone interested in bevel gears should read this book. Of course the draftsman and designer will be specially interested, but machinists also will find much to their interest.

Inventors' Manual

To readers with the inventive mind, we can refer them to the "Inventors' Manual, And How to Make a Patent Pay." by G. M. Hopkins, and revised by A. A. Hopkins. There are 133 pages in this book, with examples of mechanical and design patents at the back, in addition to regular reading matter. The usual pitfalls are pointed out, which the unwary get into, and the book is really a guide for inventors in patenting, perfecting, and disposing of their ideas. This book also sells for $1.25, and to anyone contemplating placing an invention is a worth-while investment.

Mechanical Movements

As a summing up, we refer readers in general to two books by G. D. Hiscox, M.E., entitled, "Mechanical Movements, Powers and Devices," and "Mechanical Appliances, Movements and Novelties of Construction."

These two books need no introduction to some readers who are well aware of their contents, but to the readers not familiar with these works, let the writer state, that almost every believable movement is described and illustrated. Any inventor, designer of machinery, in fact anyone interested in mechanical movements, should have a copy of each of these books. The writer, who is a designer himself, found them invaluable for his work. Here are two volumes that go forward with the best words that I can possibly speak for them. They sell at $3 each, and are worth every cent of it.

It is to be hoped that readers, after reading this article, have become convinced that technical books do aid you to bigger and better things, and now, since the winter evenings are drawing nigh, what better resolution could one make than say to themselves: "Starting now, I'm going to look into the possibilities of technical literature."

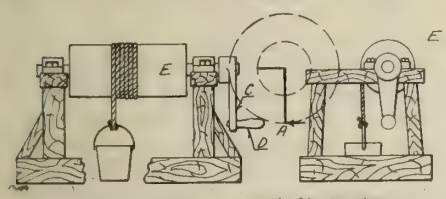
Shop Arithmetic—Wheel and Pulley Problems

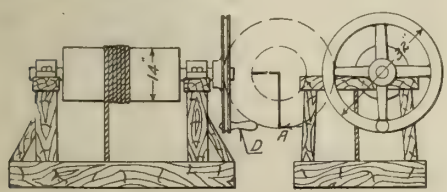
Part 12 of a Series in Practical Mathematics for the Mechanic and Those Learning the Machinist Trade. Calculations Dealing With Wheels and Pulleys Are Covered in the Present Lesson

By J. H. RODGERS, Associate Editor Canadian Machinery

IN a previous lesson it was stated that a large percentage of mechanical movements was based on the principle of the simple lever action, modified or adapted for specific purposes. This is clearly illustrated in the practical application of brake beams, rocker arms, trip hammers, safety valve levers, etc. The same is equally true in respect to wheels and pulleys, but the direct action is not so evident owing to the continuous movement in the one direction. To make the student more familiar with the evolution of the wheel and axle, and show the relative connection between it and the lever, the cut below is given.



The transition from the lever to the windlass is quite clear, and the mechanical advantage of the continuous movement is immediately recognized. The sketch in the centre shows the skeleton lever in the same position as the windlass. In raising the weight the force applied is exerted at the point A, or the extreme end of the lever, and is operating at maximum efficiency when at right angles to the direction of travel, or tangent to the circle through which the outer end of the lever moves. The crank C, is the power arm, the handle D being attached to facilitate the operation. The radius of the drum E is the length of the weight arm, but owing to the vertical pull of the rope or cable, the position of the lever may be considered as being always horizontal. Suppose now that the crank is removed and replaced with a wheel, as shown below, there is evidently no material change in the action of the mechanism.

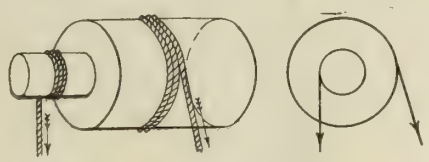


With the dimensions as given above, and neglecting the power required to overcome friction, what weight could be raised by an applied force on the handle of 100 lbs. ? Using the ratio of: the power applied is to the weight lifted, as the weight arm is to the power arm.

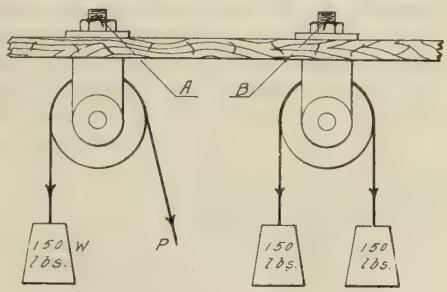
$$P : W = W_a : P_a \quad \text{or}$$

$$W = \frac{P \times P_a}{W_a} = \frac{100 \times 16}{7} = \frac{1600}{7} = 228.6 \text{ lbs.}$$

In the above example it was shown that the force required to raise the weight had to be exerted in a circular manner. With a man turning a crank of this description it is usually a very difficult task to maintain the applied force in a tangential direction, owing to the continual changing position of his arms and body, so that it will invariably be found that much of his strength is wasted, and the effective pull reduced. The one direction, steady pull, therefore, is the best where weights must be lifted through considerable distance. An arrangement of this kind is shown below, together with the leverage diagram from which the action is derived.



In the last lesson a few abstract examples were given to illustrate the connection between the lever and the pulley. We will now go into the subject more fully and demonstrate where the knowledge of figures is of considerable advantage in determining those factors underlying the practical use of such devices as pulleys and chain blocks, belting, gearing, etc. When a rope is passed over a single pulley riding in a bracket, secured to some overhead support, it has been shown that the pull required to balance the weight must be equal to it. This is quite clear from the sketch below.

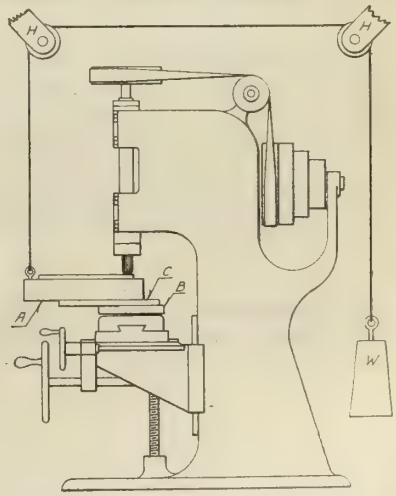


To some of the younger mechanics it might appear that the stress on the bolt supporting the pulley would equal the weight W, but a little study of the conditions will convince one that the sress will be equal to twice the weight; in other words, equal to the weight supported plus the pull required to balance the weight. This is quite evident from the right hand figure, where the pull is replaced by a weight sufficient to maintain equilibrium. The rope or cable in this case is under uniform tension of 150 lbs., but the tension on the bolts A and B is 300 lbs.

This question of rope strain is one that frequently occasions considerable controversy, among shop men, regarding the actual tension upon the rope when loaded. The difference of opinion invariably arises from lack of sufficient knowledge respecting the fundamental principles of forces in action.

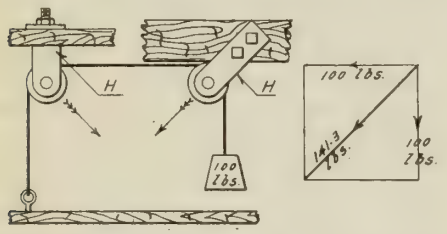
To fully understand the question of rope stresses it is necessary to become familiar with the third law of motion, namely, "action and reaction are equal and opposite"; that is to say, when a force is applied a corresponding force is extered in the opposite direction. Therefore, irrespective of how the reaction operates, it must be understood that the stress in the rope can only equal the force or power applied. This applies, not only to single ropes under direct pull, but to all individual or multiple systems. In the case of multiple block tackle, where the force applied is, say 100 lbs., this stress will be equal throughout the entire rope, with slight variation due to the additional strain resulting from friction of the moving parts.

A practical example of this character was experienced by the writer some years ago, which created considerable discussion at the time, as to the tension existing in different sections of the rope. A sketch of the problem is shown here.



This shows an arrangement provided to balance the overhanging weight of a large die, while the latter was being milled on a small vertical milling machine. Several problems presented themselves, which gave rise to no little discussion among them men in the shop; those pertaining to the strain upon the different sections of the rope, and also to the pull upon the hangers H, H, when the weight was supported in different ways. The operations on the casting A, were such that considerably over half of it would extend over the edge of the

circular table B. The auxiliary plate or table, C, was used to support the casting, which weighed approximately 300 lbs. When the work was secured in position, undue strain was placed upon the revolving table, and to overcome this, the counter-balancing arrangement was adopted, and located as shown in the sketch. The weight W, was arranged to balance the overhang of the work. The main interest in the foregoing hinged upon the strain in the rope, due to the hanging weight. It is quite clear, however, that the stress throughout the rope is uniform and equal to the suspended weight. Another point of discussion was the proper position of the hangers H, H. Opinion differed here also, but with the rope in the position shown below, the maximum pull on the hangers would be in the direction indicated by the arrow, or along the line bisecting the angle of the rope.

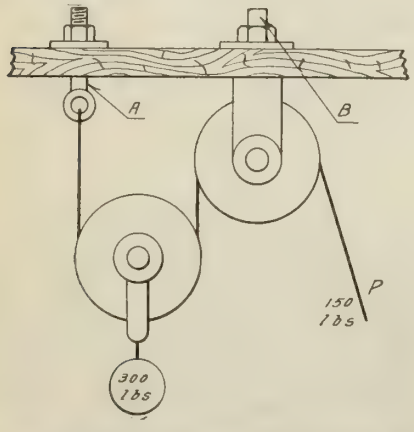


With the pull of 100 lbs. on the rope, the pull on the hanger in the direction of the arrow can be calculated from the diagram of forces shown to the right, and in this case would be equal to the hypotenuse of the right triangle, having sides representing 100 lbs. Then the pull at the bracket in line with the arrow would be:

$$\sqrt{100^2 + 100^2} = 141.3 \text{ lbs.}$$

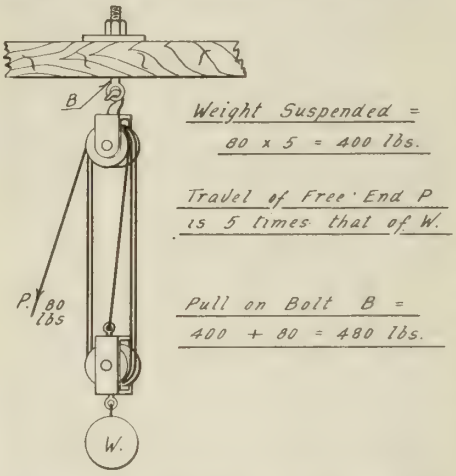
Maximum strength and rigidity would therefore be obtained by placing the brackets as shown to the right.

Suppose we have a tackle arrangement as shown below, where a force of 150 lbs. is exerted at P; what will be the weight supported, and the pull upon the two supporting eye-bolts?



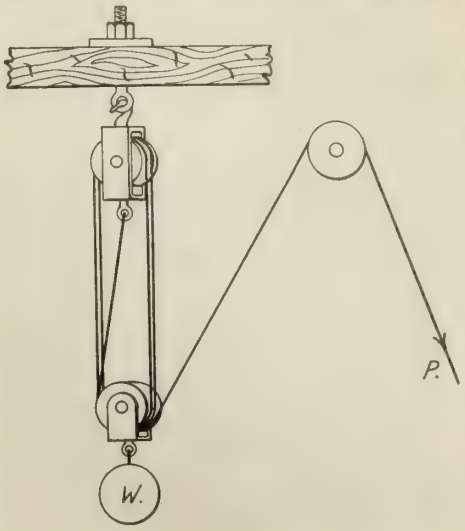
The tension throughout the entire rope will be equal to the pull at P, or 150 lbs. The weight suspended is supported by two portions of the rope, therefore, it will equal twice the force applied, or 300 lbs. The eye-bolt A, having the rope secured to it, is subjected to a tension equal to that of the rope—150 lbs., but as the down pull on the bolt B, is made by two sections of the rope, it will be under a tension of 300 lbs., and the combined pull downwards will be 450 lbs.

In any arrangement of multiple pulley blocks the calculations are virtually the same, as the principle is identical; that is, the weight supported is equal to the tension in the rope (the force applied), times the number of sections supporting the weight. The mechanical advantage is equal to the number of rope sections supporting the lower block and the load. In the arrangement here shown the mechanical advantage is 5.



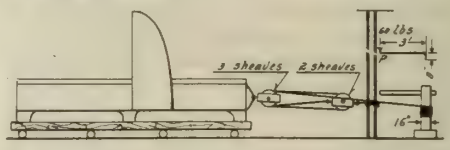
In the above instance the weight is supported by five sections, so that with a pull at P of 80 lbs., the weight W would be 400 lbs.

Whenever convenient it is advisable to place the movable block so that the pull on the power end of the rope will be in the same direction that the weight is to be moved. If the block above had been reversed, and the pull at P was upwards, the efficiency of the apparatus would have been increased, and the mechanical advantage would be 6, as there would be six sections of rope carrying the load. However, in the ordinary block and tackle this method has the disadvantage of the applied force acting above the weight to be lifted, so that to utilize the full advantage of a block arrangement, an idle pulley would have to be located to carry the free end of the rope, as shown below.



In the case of overhead cranes, where the power is located above, the pull in the upward direction can be utilized effectively, but with the power located on a level, or below the weight, the force exerted must act contrary to the moving weight.

When tackle of this kind is used to move heavy objects in a horizontal direction, as the transfer of a machine from one location to another, care should be taken when placing the blocks in position, so that the pull will be in the same direction in which the machine is to be moved.



If, in the arrangement above, a force of 60 lbs. was applied at the outer end of the lever A, and the vertical drum was 16 inches in diameter, what would be the resistance offered by the machine? It is seen that the drag comes upon six sections of rope, so that the mechanical advantage is 6. The tension in the rope is determined by solving the leverage at the windlass. The power applied multiplied by the length of the power arm (lever A) equals the weight (rope tension), multiplied by the length of the weight arm (radius of the drum B), or:

$$60 \times 36 = 8 \times x \quad \text{or} \quad 60 : x = 8 : 36$$

$$\text{then } x = \text{rope tension} = \frac{60 \times 36}{8} = 270 \text{ lbs.}$$

As the mechanical advantage of the device is 6, the resistance would be 270 × 6, equals 1,620 lbs.

In what has gone before no allowance has been made for the work required to overcome the friction of the moving blocks, which is present in all cases, particularly when operating under heavy loads. Suppose in the above case that the actual resistance of the machine to horizontal movement was 1,500 lbs., what percentage of power is utilized in overcoming the friction in the mechanism? 1,620 lbs. represents the theoretical efficiency of the apparatus, or 100 per cent., then the mechanical efficiency would be:

$$\begin{array}{r} 25 \\ 100 \\ 1620 \\ 54 \\ 28 \\ 7 \end{array} \times \frac{\begin{array}{r} 25 \\ 50 \end{array}}{1500} = \frac{625}{7} = 89.3\ \%$$

A new mineral has been discovered in Siberia. The discovery was made by a hunter on the shore of Lake Balkash, and the mineral has been named Balkashite. It has the appearance of dark-brown hard rubber, and when ignited it burns with a strong flame, leaving about 2 per cent. ash. When placed in water it becomes a mass very much like paraffine.

The Continued Supremacy of Cast Iron

By DONALD H. HAMPSON

WE hear a great deal these days about new metals and alloys, and we very nearly get the idea that the big five (cast iron, wrought iron, brass, bronze, and steel) of our fathers' days have been superseded. Twenty-five years ago, the metallurgist and the chemist and the mixers of metals had not come to the front with the bewildering variety that is offered to-day. From the reading of magazine articles and advertisements and from association with automobiles, the lay public has picked up considerable general information about materials—information which leads them to believe that every metal part that is worth while must be made of "alloys or special metals." And this is true to a lesser degree with many men in the mechanical branches—due largely to nicely worded statements of enthusiastic salesmen.

But to a greater extent than is realized at first thought, one of the "superseded" metals holds its own, in fact, is making new friends all the time. That metal is cast iron. Plain, ordinary grey iron—the cheapest of all the metals and the most adaptable. If you want a section only one-sixteenth thick or if you want a part that weighs twenty tons you can make it of cast iron and know pretty well beforehand that you can get it anywhere, any time, and that it will be just what you want.

"The bigger they come, the harder they fall," is a truism of the prize ring and it applies quite nicely to some of the vaunted substitutes for cast iron.

Take the aluminum piston for automobile engines, for example. It was going to revolutionize the business, but how many men who are in the class that has to look after their own cars will buy another car with aluminum pistons? There's an occasional exception, but it is back to the good old cast iron piston for theirs next time. Sold under various trade names, these men have found that the slight gain in weight and higher engine speed were accompanied by a loss of power unless the engine was over-hot and that the cylinder walls were saved at the expense of the pistons. Aside from the necessary sloppy fit in the bore, the wrist pins have a disagreeable habit of wearing or working loose so much sooner. It is back to the cast iron piston and a little slower speeded engine for these men who have tried.

The die casting gave poor old grey iron quite a shove to the wall. But recently, there has been a marked tendency to return to the sand cast product, especially for parts that are subject to any wear or pressure. Of course the iron casting does not begin to have the appearance of the accuracy that the die casting does. It is the permanentness of cast iron and its superior wearing quality that make it a more value than mere shape in the beginning.

Aluminum and die cast products made deep inroads in the printing business a few years ago when the market was flooded with the white metal "furniture" and plate mounting bases; these pieces were originally of wood or lead, but as the art progressed and modern machinery came in, cast iron replaced these two—to be followed by the die cast parts, that could be made of the required accuracy at a far lesser cost than cast iron. Actual usage throughout a period of years, however, showed that the white metal changed its size under printing pressures almost as easily as had the lead and that the boasted "stronger than cast iron" could not be realized. One supply house states that they would be half a million ahead to-day if they had left the other alone and stuck to the cast iron.

It is frequently stated that cast iron makes a good bearing surface for any shaft from the slowly revolving one up to a saw mandrel, yet we do not see many such because the average builder is wedded to the use of some bearing material. Two cases showing how good it is will be noted.

There are in a certain shop sixteen 2 in. milling machine spindles made of ordinary soft steel and running directly in cast iron of the headstock. These were made in 1902-1903 and were intended for using the carbon steel cutters of that day. With the general introduction of high speed steel, the machines were speeded up and as the steel bettered, more speeding up was done to keep the steel working right up to the "book speed." Just plain oil hole lubrication and ordinary operators—and not a case of refitting in all that time, though the work must always be "plus or minus, not over 0.000½ in." And the writer made and fitted a quantity of ¾ in. cast iron bearings over eleven years ago for which the factory has never had an enquiry for replacements in spite of the fact that the shafts in them run at 14,000 R. P. M.

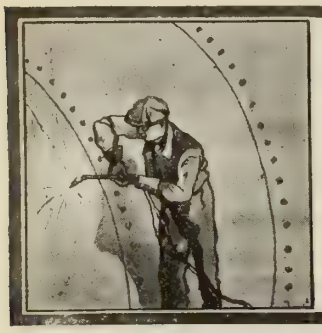
Then there is the case of the car wheel. At one time we were led to believe that the paper wheel was going to open up an era of silent, smooth running calculated to please the elect. Yet there are none of those paper wheels in use to-day and there are millions of the old-fashioned cast iron wheels rolling along smoothly and with a satisfactory degree of silence. Even the steel wheel has not made such deep inroads in the iron wheel business—not even when you can get cast iron chilled wheels that will do 80,000 miles or more and at a first cost of four cents a pound, even in these days of high prices.

Every factory has to use shafting, including pulleys and hangers. These latter items were once made exclusively of cast iron but the last two decades have witnessed the advent of pressed steel hangers and pulleys—parts which certainly are modern, light, neat, and almost indestructible. Yet if one circulates among the actual users of these products, there is found an undercurrent of reaction; one man tells you that a cast iron pulley or hanger "stays there" after it is made; another complains about the cast iron parts that are riveted or bolted in the steel structure and work loose; another machinist invites you to look at the "round" steel pulley he has in the lathe for boring, adding that if he took a cut ever it to make it round it would cut through at two points; and still another man beckons you to the scales to compare the weight of the steel product with well designed cast iron pulleys and hangers, pointing out triumphantly that the difference is hardly over five per cent.

In some automobiles we find gear cases of cast iron. The mechanic delights to work on such a car because he knows that the case isn't warped or sprung, that unless it has been cracked it is as accurate as on the day it was machined, that a touch with a hammer or a slip of a wrench will not bruise a surface to the point of inaccuracy that may escape the less trained eye of his helper.

All the metals used as substitutes for cast iron have their places—and the business could not get along now without them—but the selling talk that a competitor uses cast iron "because it is cheap, we use gold aluminum alloy" does not go as it once did and it seldom goes for re-orders. Grey iron has come out of the woods triumphant because it retains its size and shape, because it is one of the best wearing substances known, and because it can be given any reasonable form and at a cost that is not prohibitive.

Among the recent electro-therapeutical devices introduced to the public is an electric brush which, instead of being supplied current from a battery in the usual fashion, contains its own source of power. Leaving aside the therapeutical qualities of the electric brush, the present device is of immediate interest because of its electrical features. It contains a small generator which is capable of delivering currents of infinitesimal amperage, but at potentials of from 50 to 200 volts. The generator is driven by pressing a lever beside the handle, which lever operates through a chain of gears.



WELDING AND CUTTING

Oxy-Acetylene and the Safety First Movement

By A. CRESSY MORRISON, Sec. International Acetylene Association

An address delivered before the Western Pennsylvania Division of the National Safety Council.

MR. President and gentlemen of council:

Your president, with characteristic courtesy has, I fear, given you a somewhat too enthusiastic statement of my qualifications, in using the word "expert" and "authority." I must, therefore, as a preliminary, protest that I am neither an expert nor an authority, as these words will perhaps be interpreted by you in the light of your practical experience in the oxy-acetylene art.

I have, however, been closely associated with the safety rules and regulations governing the acetylene industry for many years, even before the first welding and cutting torches were used in this country. I have participated in the formulation of these regulations and have had an opportunity to observe the results of their application, but I have very much to learn from your practical experience in the actual use of the torch. I long ago became aware of the fact that it is impossible for anyone to be a real expert or an authority in any field without having personally undertaken practical work himself.

In approaching the subject which has been asigned to me, I am sure you will permit a moment's generalization. I am impressed by the fact that the Safety First Movement has become a factor in industry so late in the history of human endeavor. Our attention has recently been called to the interesting coincidence that the armistice became effective on the eleventh hour of the eleventh day of the eleventh month. Viewed in the light of the many thousand years during which human hands have wrought, it must be admitted that the Safety First movement, as expressed by such a splendid gathering of practical business men, is an eleventh hour movement. Eleventh hour movements, as instanced by the armistice, are sometimes exceedingly effective, and so, the safety first movement, as evidenced by gatherings such as this, promises to be equally so.

The growing recognition of the brotherhood of man has found expression in industry through a greater consideration for the life and limb of the employee and in a wider field in the recognition in a sociological sense of responsibility to those dependent on him.

Altruism in industry, while advancing with giant strides, has not yet reached the point where it will alone continuously sustain the very serious efforts which the members of this council are, with thousands of others, at the present moment putting forth for the benefit of the workers in their respective industries.

Fortunate, there is, supplemental to the idea of benevolence, but of vital importance in assuring permanence to the Safety First Movement, the growing recognition of the superb fact that effort put into this movement is highly profitable. Great as is the effort of the present, the Safety First Movement is therefore but in its beginning, but its permanence is further assured by the marvelous growth during the war of humanitarian ideas and a realization of mutual dependence coupled with a higher evaluation by the industries of the faithful employee.

The wise employer recognizes as a fundamental of complete success that the maintenance of the health, comfort and safety of the employees is of paramount importance. Permanent relations between the employer and the employee in good health means experienced service and highest efficiency for both. To me the Safety First Movement already presents a means of communication with the employee which has won his confidence and through which many of the problems of readjustment, which now cause anxiety, may be solved without the sometimes predicted industrial disturbances.

I have said these things to you, knowing you would pardon a slight digression from the subject of the hour that I might show you that knowledge of your great work is abroad in the land, and that those who observe your activities appreciate its importance and its sound philosophic basis.

In discussing the oxy-acetylene blowpipe, my subject naturally divides itself into two parts—one part dealing with safety in relation to the manufacture and transportation of material and apparatus used in connection with the art of welding and cutting, which, of course, includes the containers. The other part deals with the use of these substances and mechanisms.

If I deal with the first part of the subject and show the efforts which have been put forth to place in the hands of your workmen a safe apparatus and pure elements in safe containers, we can, when we come to the discussion of the rules governing actual use, see to what extent existing codes need to be supplemented in order to protect your employees and the whole industry adequately. This, of course, is our aim.

I will begin with the substances themselves—calcium carbide, acetylene and oxygen.

Calcium Carbide

Calcium carbide became a commercial fact because of the discoveries of L. Willson, an electrical engineer at Spray, N. C., who used an electric furnace for the production of metallic calcium. He secured a melted mass of dark color, which, on cooling, became solid and brittle. The substance was not the material for which he was searching, and some of it was thrown into a neighboring stream, when it was discovered that a gas was being evolved. This gas, when ignited, gave off quantities of soot, showing that it was not hydrogen, but a rich hydro-carbon gas. Upon investigation this was found to be acetylene. Thus calcium carbide was first manufactured during the experiments at Spray which took place in 1892. From this small beginning, such a short time ago, has grown the manufacture of calcium carbide which now girdles the world, the quantity produced running into the hundreds of thousands of tons, and its usefulness in many fields has proved to be of surprising importance.

Calcium carbide is manufactured in

the electric furnace at a temperature of about 7,000 degrees Fahrenheit, the raw materials being lime and coke. The resultant substance, calcium carbide, is a true chemical combination of calcium and carbon. It is tapped from the furnace and cools into ingots which are broken in stone crushers, screened to size, and packed in steel drums. It is then ready for shipment.

Calcium carbide is not an explosive, is not inflammable, and is not affected by concussion. These facts are shown by the crushing operations through which it is reduced to marketable sizes, and by the fact that it has already been subjected to the highest temperature man is able to produce. It, therefore, will not burn; nor is it affected by any heat other than the electric furnace itself.

Calcium carbide is unaffected by any of the elements with which it comes in contact, save water. It will slake if left exposed to the air because there is sufficient moisture in all normal air to produce its slow disintegration. There is never enough moisture in the air to produce enough acetylene from calcium carbide to form an inflammable mixture of air and acetylene, and under ordinary conditions of exposure to air there can be no accumulation of acetylene because the carbide exhausts all of the moisture from the air in its vicinity and cannot get any more until the dry air and acetylene has passed on and fresh air has taken its place.

Calcium carbide, if exposed to water, instantly produces acetylene. The amount of acetylene produced by commercial calcium carbide varies with the conditions, but is usually more than 4½ cubic feet and not more than 5 cubic feet to the pound.

Calcium carbide is packed in Government-regulated lapped seamed steel drums with a double cover. These drums in vast quantities have withstood for many years the vicissitudes of transit, both on land and overseas. The steel drums have been subject with the contents of calcium carbide to fire and flood under all possible conditions of exposure, and the record is excellent. So good is the record, indeed, that calcium carbide, which was at one time regarded with anxiety, is now shipped freely everywhere and has been removed from its list of dangerous articles by the Interstate Commerce Commission, and even from its list of articles which were at one time classed as doubtful. The underwriters, in their regulations, stipulate only that calcium carbide shall be kept in a dry place above the ground, and that where quantities in excess of 600 pounds are stored in one place it shall be stored in a building used exclusively for such storage, or in a specially constructed generator house. I think it is safe to say, therefore, that calcium carbide, as delivered to you for use is completely safeguarded, and that if the simple suggestions put forth by the underwriters are followed, it need not be regarded as a hazard by you.

Acetylene

Acetylene, which has it commercial origin solely in calcium carbide, is a hydro-carbon gas. It comes to you in two ways—one through its manufacture from calcium carbide by means of a mechanism known as an acetylene generator, and the other compressed into standard acetylene cylinders.

Acetylene found its first usefulness as a means of illumination. For this purpose acetylene generators were devised. From the beginning, the National Board of Fire Underwriters, the Underwriters' Laboratories, and upon its formation, the National Fire Protection Association, assumed jurisdiction. As experience developed, rules and regulations for the construction of acetylene generators were devised and revised. Inventive genius was called into play to evolve a proper burner by which acetylene, so rich in carbon, could be made to burn with a brilliant, steady flame.

Acetylene produced by means of an acetylene generator has most of the characteristics of other hydro-carbon gases. The mention of a few of these gases will be illustrative, for instance, coal gas, water gas, gasoline, etc. Acetylene, however, does not contain carbon-monoxide, which renders coal gas and water gas poisonous and may be breathed mixed with air without any detrimental physiological effect. Like the other hydro-carbon gases it burns to carbon-dioxide and water vapor so there are no fumes from acetylene and consequently no danger from the products of its combustion.

Acetylene will ignite when mixed with air, provided the acetylene reaches three per cent. and under normal conditions, does not exceed thirty-five or forty per cent. Its rather wide range of ignitability is sometimes emphasized, but the real question is how small a percentage mixed with air will ignite, and the question of how rich the mixture has to be before the flame will be extinguished may well be excluded.

The development of the use of acetylene for lighting is very extensive and increasing. Over 300,000 homes, especially those in isolated locations, are lighted with acetylene. Acetylene is the dominant means of illumination in the non-gaseous coal mines and metal mines of the United States. Perhaps 700,000 miners use acetylene, carrying individual miners' lamps on their caps whenever they enter the mines. A very extended use and one of great value is the illumination by acetylene of aids to navigation, beacons and buoys. Acetylene, with its brilliant rays literally covers the world where warning marine guides are necessary. Acetylene has a wide use in contractors' lights where high candle power is needed in outdoor work.

The knowledge of the production and the characteristics of acetylene acquired by the underwriters while the development and use of lighting mechanisms was taking place, laid the foundations for the properly safeguarded apparatus now used for the manufacture of acetylene for use in the oxy-acetylene blowpipe. Mechanisms which have passed the underwriters are known as permitted generators. The cost to the manufacturer of an acetylene generator who desires to submit his apparatus for approval by the underwriters is small, and experience has shown that the underwriters' standards are necessary. You need not be anxious regarding the generator provided you purchase of the several makes which have been passed upon by the underwriters, and then install it in accordance with the rules and regulations which have been very carefully developed from the long experience of the National Fire Protection Association and the better class of manufacturers. One of the best rules of safety engineers is to avoid any generator which has not been approved, although many cheap devices are being offered.

The simplicity of the reaction between carbide and water is such that a great many shop engineers feel confident that they can devise an acetylene generator. An engineer who is perfectly sure that an inexperienced theorist would be incapable of doing things which he does so well, often feels that he can undertake matters which perhaps require quite as much experience in another field, and that he will prove an exception. The expectation of the inexperienced engineer who thinks he can make an acetylene generator and avoid all hazards which experience has now properly safeguarded should not be relied upon by safety engineers. The manufacturer who will refuse to submit his generator to the impartial and very careful examination made by the underwriters should not be trusted by safety engineers. A man is properly safeguarded if he will purchase a first-class generator from a reputable manufacturer which is listed as having the approval of the underwriters.

Where acetylene is used from cylinders, the industry has, with the aid of the underwriters and the Interstate Commerce Commission, developed safety to an equally high degree. The acetylene cylinder which must be approved by the Interstate Commerce Commission and which has passed the rigid examination of the underwriters' laboratories, is something more than a steel enclosure in which the acetylene is confined. Many people do not understand that these cylinders are completely filled with a porous material, such as asbestos, which, when compressed into the cylinder vigorously still leaves a porosity equal to about 75 per cent. of the capacity of the cylinder. Acetylene could now be compressed into the cylinder, but the quantity which the cylinder would hold at the low pressure of 250 pounds, which is the limit fixed by the Interstate Commerce Commission would be very small. A means must, therefore, be devised to increase the capacity of the cylinder for acetylene, and this is accomplished in a most interesting way. Acetone, which is a liquid related to the wood alcohol family, has peculiar characteristics in relation to acetylene. It will, for each atmosphere of pressure, absorb twenty-five times its volume of acetylene. The asbestos in the cylinder is, therefore, saturated with acetone up to about 50 per cent. of its porosity, whereupon when acetylene is compressed into cylinders it is taken up by the acetone and this is

why 300 feet of acetylene is compressed into an acetylene cylinder at 250 pounds pressure, while the size of the cylinder would indicate that the quantity contained was very much less. The acetylene being both absorbed by the acetone and entangled in the interstices of the asbestos makes the progress of the explosive wave in the cylinder impossible, and this accounts for the fact that with the extremely extended use of acetylene cylinders, accidents from any cause are few.

In speaking of acetylene cylinders and the absence of hazard, it must be understood that I am confining my remarks regarding their safety strictly to those cylinders which meet the laws of the United States as expressed through the Interstate Commerce Commission and which have had the approval of the underwriters. If the use of acetylene from cylinders is confined to those which have met these requirements the user is properly safeguarded.

The reason for the difference between the methods of compressing acetylene and other gases has not likely been given consideration by you as it depends upon the peculiarity of acetylene in which it differs from other hydro-carbon gases and is indeed unique.

The very high temperature of the oxy-acetylene flame is due not only to the combustion of the acetylene which means a chemical combination of the hydrogen and the carbon of acetylene with the oxygen, but to another quality which raises the temperature from the 4,000 degrees which marks the apex of temperature in any other combination to 6,300 degrees which is approximately the temperature of the electric arc. This peculiarity of acetylene and the extra vigor of the flame which makes it the only available flame by which general welding can be accomplished is due to the fact that when acetylene is formed, during reaction between the carbide and the water, the molecules take up heat instead of giving it off. The amount of latent heat locked into the molecules of acetylene approximates 300 British thermal units. This latent heat is called endothermic energy. When acetylene burns, the moment the molecule enters the flame it breaks, releasing its endothermic energy, and instantly the hydrogen and carbon combine with the oxygen adding to the combustion, and the temperature of the whole is thus concentrated in an instantaneous dissociation and recombination which acetylene its unparalleled temperature and its far-reaching usefulness.

The endothermic energy of the latent heat of the acetylene molecule must of course be given consideration when acetylene is compressed, for with each added atmosphere of pressure the distance between the molecules is reduced. It is a well established fact that when acetylene is under ordinary conditions one molecule may break and release its energy without having any effect upon those surrounding it, but when the distance is reduced by pressure the releasing of heat of one molecule will affect the whole mass and instantaneous dissociation takes place. The possibilities of accidents from this source were early ascertained and the result has been that throughout the world laws have been passed which forbid the compression of acetylene above 15 pounds to the square inch unless the compression is done under well-known technical conditions and unless the compressed acetylene is immediately absorbed in cylinders containing asbestos, Kieselguhr or similar approved porous material, saturated with acetone or a similar approved solvent.

I have gone into the details of this subject so as to impress upon you as safety engineers the necessity of avoiding any attempt to compress acetylene into cylinders by any of the methods of compression used for other gases. I wish to warn you further against what appears to engineers to be a very simple method of securing acetylene under pressure by means of a generator so constructed that the carbide and water are brought together and the resulting gas accumulated until the desired pressure is attained. These generators are known as self-compression generators and at one time were constructed and held forth as safe by unscrupulous manufacturers with disastrous results. They are forbidden by the rules of the undewriters and by laws and ordinances in all countries, but occasionally even to-day I find foolhardy people who think they can disregard to world's experience. As this is a technical body I am sure that a moment's reflection will show that you should set your face against the use of unlawful generators. The approved generators limited to fifteen pounds pressure and the approved cylinders have been so well devised as to successfully safeguard the production and distribution of acetylene to the torch.

Oxygen

Oxygen is the only other element with which we are concerned at the moment. We are inclined to treat oxgen because it has been an article of commerce in notable quantities for but about ten years, as if it were something new or unusual, forgetting that one-fifth of the air we breathe is oxygen. Every fire that burns is an exquisite chemical experiment disclosing to us the combination of oxygen with some combustible substance. One-half of the earth's crust and one-fifth of the atmosphere, one molecule out of every three of the rolling ocean is oxygen. So far as man is concerned, oxygen is our most abundant and most active chemical element. One would suppose that it would have been separated from its combination and mixtures and utilized long before.

I never breathe a breath of fresh air feeling its vital necessity, or quench my thirst from the living spring, or see green nature changing carbon dioxide into trees, fruits and flowers, or warm my body before the hearth fire without an interior sub-conscious thankfulness to God for his greatest gift—oxygen.

Oxygen has for some years been produced for a medicinal purpose, giving a stimulating breath of life to tide over the most tragic and critical moments in the sick room, but it remained for acetylene, one of the later children of man's ingenuity, to bring into commercial being the most abundant and necessary element.

When acetylene and oxygen combine, the warmth of their affection seems to indicate a true affinity which the excessive and accentuated temperature demonstrates.

Oxygen may be produced by breaking up certain chemical combinations or by sifting the mixed molecules of oxygen form the nitrogen of the air. Many elements will absorb or combine with oxygen at one temperature releasing the oxygen at a higher temperature. In some cases the range is too extreme to be useful, but in some cases oxygen is absorbed at atmospheric temperature and given off at temperatures easily attained. Certain processes for the production of oxygen known as the chemical method were based upon this fact. At the present time, however, these processes have been abandoned, and therefore need not be considered.

Chemical combinations may be broken up by electricity, and in water we have a chemical combination which contains but two elements—oxygen and hydrogen. If an electric current under suitable conditions is passed through the water the molecules of water are broken up into one part oxygen and two parts hydrogen, the oxygen will collect at one pole and the hydrogen at the other. If the elements are kept separated we have, by means of the electric current a method of producing oxygen and hydrogen from an unlimited source of raw material—water. The amount of energy required, the method of its application and the means by which the oxygen and hydrogen are kept separate involve high engineering talent and experience. The hazards of a mixture of oxygen and hydrogen in the same cylinder while sufficiently obvious still call for a note of warning to those who would undertake the manufacture of oxygen by this process, that all necessary precautions must be taken. The use of oxygen from this source should not be undertaken until the Safety Engineer assures himself that the plant is backed by well regulated and carefui business organization in the hands of thoroughly experienced and conscientious people. If the production of oxygen by this process is to be undertaken by the user, experienced men should be in charge capable of making frequent accurate chemical analyses to check purity of both products in manufacture as well as in use.

The other source of supply of oxygen is the air itself. It has been discovered that if the air is cooled until it liquefies, by a delicate process of distillation nitrogen may be distilled off leaving the oxygen behind just as in the case of fermented mixtures the alcohol may be distilled leaving water behind. So successful has this process become that a very large percentage of oxygen now produced is made available by the liquid air process. The impurity in liquid air oxygen is the nitrogen of the air and the

resulting product is, therefore, without any hazard from the possibility of chemical recombination.

The production of oxygen is now a very large industry and plants and warehouses are widely distributed and adequate supplies are available everywhere. The question for the safety engineer is simply one of proper precaution as to the source of supply. If the oxygen is manufactured for use at the plant the serious considerations are the selection of high-class apparatus, its installation and securing the technical ability necessary to run, manage, and safeguard it.

Cylinders

On the question of cylinders, the Interstate Commerce Commission has spoken, and hazard from the cylinders as regards pressure explosions may be said to be eliminated. An oxygen cylinder contains oxygen compressed to 1,800 or 2,000 pounds to the square inch and has proved itself to have an adequate margin of safety to hold these pressures under all vicissitudes of transit and use. Literally millions of fillings and shipments have taken place each year, and accidents under ordinary conditions of use may be considered as negligible.

Apparatus

The apparatus used for combining oxygen and acetylene at the point of use which means the pressure gauges, regulating valves, hose and the blowpipe itself, are again under the jurisdiction of the underwriters' laboratories. Approved and permitted apparatus of high-class is built sturdily for use, is calculated to burn the gases with the greatest possible efficiency, both as to consumption and resultant available temperature. The user having selected his apparatus with these facts in mind attempting no short-cuts or false economies, will find himself protected at every turn by the co-operation of the best part of the industry with the underwriters, who happily, in anticipation of the development of the welding and cutting art in this country, laid down rules and regulations which have governed it ever since.

I have attempted to show that from the manufacture of the materials which you are called upon to use through the mechanisms of manufacture, transportation and use to the very tip of the torch in the hands of your workmen, the Government, the underwriters and the industry have co-operated with the idea of safety first being the basis of the widest possible use of an exceedingly valuable addition to the tools of industry.

As safety engineers you have but to adhere to the principles so carefully developed; buy good quality mechanisms and material, install your apparatus in accordance with the highest accepted practice, avoid experimental short-cuts, discourage false economies, and keep the welding and cutting torch in the hands of responsible people imbued with the spirit with which you are endeavoring to make a part of your employee's life, that is the spirit of safety first.

In expressing to you my appreciation for your patient hearing I respectfully suggest that as the oxy-acetylene cutting and welding torch is placed in the hands of your workmen properly safeguarded, we may now well discuss the rules and regulations proposed by your secretary which will properly safeguard its use.

STANDARDIZATION AN AID TO WORLD PEACE

At the dinner given in honor of Mr. Charles LeMaistre, Secretary of the British Engineering Standards Association, by the American Engineering Standards Committee, the guest of the evening, expressed the opinion that one of the strongest ties which can bind two or more nations together is engineering and industrial standardization.

This, the first function to be given by the American Engineering Standards Committee, took place at the Engineers' Club, New York city, Thursday evening, September 18th. It was attended by more than fifty engineers, representing practically every organization interested in the development of standards.

Responding to the invitation of Chairman Comfort A. Adams, who acted as toastmaster, Mr. LeMaistre said in part:

"Human language is but a very poor interpreter of the highest thoughts of the human mind, and I must plead with you and ask your indulgence as I can only be but a poor interpreter of the very high ideals which the British Engeering Standards Association has always set before it. The B. E. S. A. was formed in 1901 at the instance of Sir John Wolfe Barry, the doyen of our engineering profession, and it was through his able guidance during some sixteen years of the most important period of its existence that the association gradually gained the confidence of the people. We are now an organization of some three hundred committees and twelve hundred members who give their time fully to the work.

"Though much of the work of our committees is done in London, many of them meet in the centres where the particular standard under discussion is manufactured. This assures at the very outset that those people who are going to use the standards and who are in daily contact with the apparatus involved, and who have the closest knowledge of the details, shall put up the first proposals. This is not quite what we used to do, but we realize more and more that standardization is, shall I say, 15 per cent. technical and 85 per cent. human. Standardization is an industrial matter, and it is the industry that should put up the standards and get the help of the engineers and experts to support them.

"I hardly like to go into a discussion of the general principles of standardization, because I should feel that I was talking to my masters. However, we agree that standardization means efficient production. It can only be effective when overlapping is avoided. Overlapping can only be obviated by the operation of some central organization, which we have provided in Great Britain with wonderful effect. We find now that overlapping of effort is becoming less and less each year, and the B. E. S. A. is becoming more and more recognized as the central authority for drawing up standards for the engineering and allied industries.

"During the last year or two I have received at my office numbers of letters from America inviting co-operation, and I have always been in some difficulty to know how to reply. Take for instance, the Electrical Industry, which has in this country at least a dozen organizations doing standardizing work. A request from one of these could not be accepted as from all. My association feels that, at the present important stage of the development of the work and of the closer relationship with the United States, if only we could get co-ordination of standardization on both sides of the water, one central authority on each side, it would not only help our industries enormously, but we could work hand in hand on these technical problems which involve this complicated human factor. And in doing this big work we would surely be no mean influence in promoting the peace of the world.

Following Mr. LeMaistre's address, Chairman Adams called for responses from the representatives present. Dr. C. O. Mailloux spoke as the chairman of the American Committee of the International Electro-Technical Commission, and as a close friend and admirer of Mr. LeMaistre. Mr. Nelson P. Lewis, past president and representative of the American Society of Civil Engineers, pledged the support of his society of the contemplated development of the American committee. Professor Charles F. Scott reviewed the beginnings of electrical standardization in America, which he regarded as the basis of international electrical standardization accomplished so far. Mr. Edwin M. Herr represented the American Society of Mechanical Engineers, and also spoke for this society. Mr. Guilliaem Aertsen of the American Society for Testing Materials, introduced a pleasing analogy to emphasize the necessity for developing team work, which helps not only the team, but the individual as well.

Dr. S. W. Stratton, Director of the Bureau of Standardization, reiterated the readiness of the Government Departments to co-operate in the development of the committee's programme, and Mr. Charles M. Manly, President of the Society of Automotive Engineers, pledged his society. Mr. Ira H. Woolson represented the National Board of Fire Underwriters, Mr. A. Cressy Morrison spoke for the National Safety Council, Mr. G. H. Ramsdel told of the standardization work of the American Gas Association, Mr. B. F. Waterman represented the American Gear Manufacturers' Association, Mr. Charles W. Baker spoke for the Technical Press, and Mr. D. Knickerbocker Boyd told of the great need of standardization in building materials and design.

DEVELOPMENTS IN SHOP EQUIPMENT

HACK UNIVERSAL RELIEVING MACHINE

THE "Hack" high-power universal relieving machine is made in 6-, 10- and 16-inch sizes by the American Machine Tool Engineering Works, 4854-4858 W. Kinzie St., Chicago, Ill. This machine is constructed with the pan and legs cast integral, the pan being located close to the floor in order to afford space for a bed of ample width and depth. The bed is designed with two distinct sets of ways; the headstock and tailstock are carried on one set, and the carriage is supported by both sets. The second set of ways serves the additional purpose of supporting the side relieving attachment. The lead-screw is located between the rear set of ways on which the carriage travels, this location permitting of an exceptionally free movement for the carriage.

The headstock includes a number of new features of design, some of which are quite radical. Attention is called to the self-contained countershaft which forms a part of the head. Power is transmitted to this relieving machine directly from the lineshaft or jackshaft, through one forward and one reverse belt, without idlers or intermediates of any sort. The drive is carried from the pulleys to the head through a Carlisle-Johnson friction clutch, which is very sensitive and permits of instantaneous forward or reverse movement. Power is transmitted directly from the countershaft pulleys through spur gearing of various ratios to the spindle. Most of the gearing of the headstock is machined from 60-point carbon steel forgings, the bull gears having teeth of 4 diametral pitch in the 16-inch machine. Speed changes are obtained through sliding gears which are controlled by five levers, the gearing being as nearly fool-proof as possible and running in a bath of oil, which insures proper lubrication of all parts in the headstock. The spindle bearing and other bearings, regardless of how low the rate of rotation, are supplied by sight-feed oil-cups and tubes, making it readily apparent which bearings are obtaining the proper lubrication and which are not.

At the right end of the relieving machine there are two quadrants, one for change-gears for such leads as may be desired up to approximately 6 inches, and the other controlling the cam driving shaft which extends along the back of the machine. These change-gears correspond with the number of gashes or with the spiral of the gashes as the case may be. The rear cam driving shaft is driven through change-gears from a stud in the rear end of the headstock, this stud obtaining its power directly from the large bull gear, although it rotates at six times the speed of the spindle at all times. By means of a ratchet dog on the camshaft the cam movement is suspended while reversing the spindle, and is ready to continue its rotation at the proper point when the spindle is again run forward. This cam driving shaft extends the entire length of the machine and is supported in bearings at both ends. From it power is taken to rotate the cam arbor driving mechanism at the back of the carriage as well as the driving mechanism for the side relieving cam. Adjustments are provided to make it possible to time the two cams either in unison or independently, as may be desired. The side relieving attachment causes the entire carriage to move, while the regular relieving arrangement causes the cross-slide to move.

The carriage cross-slide and the compound slide are liberally proportioned to take the tremendous force which can be transmitted through the spindle. The tool-block, which in itself is a horizontal slide, is made of carburized cast steel, hardened and ground on all working surfaces, thus insuring a rigid, accurate tool-block. The design permits of making micrometer adjustments when required or the tool-block may be securely locked. A safety device within the headstock prevents the carriage from being run against the headstock by accident. Likewise, a safety device on the tailstock prevents running the carriage into the tailstock. The tailstock is made in one piece, permitting of absolute alignment with the spindle at all times. No provision is made for handling tapered work. When taper relieving becomes necessary, a special spindle with an offset centre may be furnished. The bolts and clamps for the tailstock are of such proportions as to make the tailstock as rigid as the headstock.

The carriage is actuated by means of a rack and pinion movement within the

HACK HIGH POWER UNIVERSAL RELIEVING MACHINE.

apron. A special mechanism is incorporated within the apron to provide for concave relieving, the purpose of which is to relieve the bulge or barrel effect which occurs in all hobs and cutters several inches in width, as the result of hardening. The arrangement of this feature is such that where three hobs or more of a kind are placed upon the

ANOTHER VIEW OF THE MACHINE.

relieving arbor, each hob can be produced with a concave contour corresponding exactly in curvature and depth with that of the other hob in that set; or where one large hob is being made, the curvature can be distributed in its proper form over the entire length of the long hob. This curvature is controlled entirely from the mechanism within the apron and can be readily adjusted and set up for any desired length or depth of curvature. This relieving machine is completely universal, and is capable of relieving spiral or straight-gashed hobs, plain formed cutters and right or left-hand counterbores, as well as performing internal relieving operations on special tools when such may be required. The weight of the 16-inch machine is approximately 8,000 pounds. Its capacity is such that it will take a cutter 14 inches in diameter or one 16 inches long. However, cutters of 6 inches in diameter or smaller can be successfully relieved upon this machine. For work varying in diameter from 6 to 10 inches, the 10-inch machine is recommended, and for work smaller than 6 inches in diameter the 6-inch machine is capable of answering all requirements.

FEDERAL SELF-OPENING DIE HEAD

The self-opening die head which is made by the Federal Products Corporation, 393 Harris Ave., Providence, R.I., is so arranged that ordinary button dies, procurable at almost any tool supply house, may be used instead of specially made chasers. These button dies are split and the rough edges ground off at a slight angle, after which they are ready to insert in the die head shown in Fig. 1. Fig. 2 shows another view of the die head, the parts in this view being disassembled.

The die head, as can be seen, is very simple in construction and can be cleaned in a minute or two without changing the adjustment. The die sectors are firmly held in the jaws and positively supported around their entire circumference so that they will cut a straight, full and accurate thread. Any thread within the range of button dies may be cut with this die head. The die may be closed by hand or by an automatic lever device when used in a turret lathe. The die holder may be used in the turrets of hand or automatic screw machines or in a lathe. All parts are made of alloy steel, carefully heat-treated and hardened.

FIG. 2—THE DIE HEAD DISASSEMBLED.

THE HANDLING OF CRUDE RUBBER

A rather important change in the manner of handling crude rubber in the Far East has been made in the new general custom in the trade to pack the product in bales for ocean shipment instead of in the comparatively loose packages in which it has been shipped heretofore. The practical effect of the new method is to reduce the bulk of the product packed for shipment by about half and on the average to cause its weight to approximate its bulk in ship's ton measurement, i.e., 2,000 pounds of rubber baled occupies substantially 40 cubic feet. In shipping this has the effect of classifying rubber as heavy cargo instead of light cargo and materially affects the nature of shiploads leaving the various Far East rubber exporting ports

Wasting Too Many Hours

CANADA has been facing a great chance ever since the close of the war. The world wanted everything that this country was in a position to make. Countries that had been at war for four years were at once customers, and big ones too, as soon as credit and terms were arranged.

Canada has, in a great big sense, been kicking this opportunity around ever since the war stopped.

The only thing most necessary has been production, and still more production.

The one thing that has been most outstanding in all our commercial blunders has been the manner in which production has been curtailed.

The mechanical world failed to grasp the big reason for high wages during the making of munitions. That big reason was PRODUCTION. Had production been stifled or output regulated according to "this much per day and no more," wages would not have been anything to compare with the pay envelopes that munition workers carried home during the war years.

During the month of July, Canadians, in strikes and lockouts, blazed away 561,010 working days. In August, they idled 316,187 working days. In two months 877,197 days. In another way, one man, could he live that long, wasted 2,923 years, counting 300 working days to the year.

Now, it is as plain as the nose on your face that this country cannot stand that.

Strikers can argue until they are black in the face that speedy production will soon fill the world's markets and in that way make more workers than jobs, but they cannot get one inch away from the economic fact—not theory—that lack of production and a great buying wave is keeping prices up on everything they have to purchase.

Canada should get to work. Britain is not in a position to export. United States has troubles that keep her factories strained in many lines to attend to domestic needs. Canada, rich in minerals, rich in forests, rich in water powers, rich in broad acres of good farming lands, can go in and produce and grow without any fear of forcing any man out of work.

Remember, by this we mean that a man going to work must become a worthy producer. We have now an excess of people who persist in camping on the necks of those whose business and work justifies their commercial existence.

We do not mean that we call upon men to go to work if their going is simply the means of jamming another raker in the line of those who have wedged in between producer and consumer.

But it's time serious-minded Canadian citizens, we care not whether members of unions or employers of labor, make this a chief matter of concern.

The only danger lies in the fact that industrial life has had such a gruelling in the matter of strikes and unrest, that it may not rally as quickly as the needs of the case call for.

It is not possible to let a certain line of goods go to the dogs for six months, and then expect, on resuming manufacture, to find marketing and production on a par with the day of cessation.

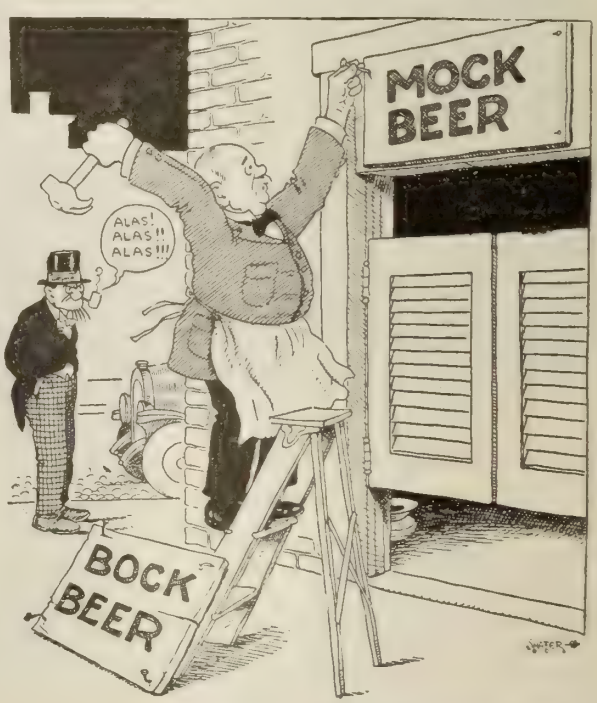
THE latest thing is shipping whiskey and marking it as castor oil. If Old John Barleycorn has to make a face like a mouthful of castor oil in order to get past, we feel sorry for him.

* * *

THERE are many striking things—and people—in this old world.

* * *

DURING the war one big British concern, the Manganese Bronze & Brass Co., turned out propellers for the largest British war vessels. The castings weighed 30 tons each, and were too large for rail transit, and, as it was considered too dangerous to risk despatch by sea, they were forwarded by road 450 miles from Glasgow. The propellers cost $25,000, and the haulage charges were $17,000.



Shafer in Cincinnati "Post."

Signs of the times.

Germany's Copper Shortage

ONE result of the Allied blockade of Germany was seen in the many expedients to which the Hun was forced in the obtaining of the 120,000 tons of copper necessary annually for military requirements. Home production was only about 23,000 tons per annum in pre-war days and this was reduced to about half owing to the mobilization of the miners.

The *Technical Review* in a translation of an article from *Technick und Wirtschaft* gives some further interesting data relative to the economies practised. During the first two years of the war the deficit was partially covered by booty from Belgium, France and Russia. Large quantities of scrap copper and brass were collected from munitions works and from fittings on naval and mercantile vessels, the scrap being smelted and refined.

Copper and iron-bearing slags were treated by the Dwight-Lloyd process, the roasted product with 30-80 per cent. Copper being refined to 89-90 per cent. and cast into cathodes. Brass scrap was smelted in basic Bessemer converters, in which by using a compressed air blast the refining process was shortened from several days to a few hours. The zinc fumes were cooled in a system of tubes to 50° C., and collected in bag filters, the contents of which were compressed into blocks and converted into metallic zinc by the electro-thermic process.

Bronze scrap with about 90 per cent. copper and 10 per cent. zinc was successfully treated by electrolysis, the metal being formed into cathodes which were electrolyzed in copper sulphate, several weeks being required for the deposition of the copper. The dried sludge from the process contained up to about 60 per cent. of tin which was recovered as pure metal.

To minimize the consumption for army purposes all brass and copper uniform badges were abolished and zinc replaced brass in munitions. In spite of rigid economy the consumption remained enormous, and by the end of 1916 stocks had become exhausted. This necessitated the substitution of iron in cartridge cases, caps and driving bands, all tubes and wires in electrical plant, torpedo tubes and propellers on small war vessels. For medium shells, zinc driving bands were used, and electrolytic iron for those of large calibre.

In the navy, cast brass (55-60 per cent.) replaced Admiralty bronze, the tendency of the former alloy to pipe and froth in casting hollow articles being counteracted by making the gate of equal capacity with the mould, and allowing time for the included oxides to rise to the surface before actually running the metal into the mould. The risers were also plugged and the imprisoned air only released when the mould was nearly full. These alloys failed to withstand friction and, therefore, parts exposed to heavy wear had still to be made of Admiralty bronze.

The Steel Strike

THE steel strike in United States gets short shrift from Rev. P. Molyneux, pastor of St. Brendan's Roman Catholic Church at Braddock, Pa.

His parish is right in the steel mill district. He said on a recent Sunday in his church: "This strike is not being brought about by intelligent or English-speaking workmen, but by men who have no interest in the community, and who do not have the welfare of the men at heart."

Father Molyneux said to his congregation that he held no brief for any mill or any company or any trust. Within the last two weeks, he said, he has talked with at least 200 mill workers with regard to the strike, all intelligent, English-speaking workmen, some from his own parish and some from outside. "I could not find one instance," he said, "among these 200 men where the man wanted to go on strike. They all stated positively and clearly, on the other hand, that they were well treated and satisfied with conditions.

"There is one thing I have noticed about these strike leaders," continued Father Molyneux, "and that is, with very few exceptions, if any at all, they never had on a workman's blouse in their lives, never went into a mill in a pair of overalls—these men were never seen with th honest sweat of toil on their brows. The tan of brawn is not on their hands. They are a lot of smooth, oily tongued talkers, with a kind of sympathetic whine appealing to you. They are royal gentlemen of leisure; they always wear fine clothes."

It has not been explained why Samuel Gompers tolerates the leadership of William Z. Foster in this strike, unless it is that Mr. Gompers has some special and unpublished reason for fighting the head of the U.S. Steel Corporation.

The strike bears the earmarks of agitation rather than of an abused people battling for better conditions.

On the other hand, it has been shown beyond successful contradiction that employees of the Steel Corporation are well paid, work reasonable hours and in the main are well satisfied with their work.

Shipments from Strike

Warehouses Are Better Off Tha
Rollers for Each Separate Orc
Machine Tools on Account of

SHIPMENTS are coming through to Canada from mills in the steel strike zone, but it must be admitted that these shipments are not as large or as frequent as the demands of the trade. It is a peculiar situation, but a true one, that the warehouses are better off than their customers in many cases. Warehouses deal almost entirely in standards, while their customers want as well orders rolled to specification. The warehouses can draw for some time on the accumulated stocks at the U.S. mills, but orders that must be rolled now are going to be slow in delivery.

A conservative estimate seems to place the men out on strike at forty per cent. It does not follow that production has only decreased forty per cent. It has decreased more than that, because there is no doubt that in some cases men are kept on for the moral effect rather than for their ability to turn out iron or steel. It cannot be said that Canadian trade is suffering yet. The Canadian mills are handling an increased tonnage in several lines. If the strike continues for several weeks yet there will be concerns on this side of the line hard pressed for their raw materials in manufacturing processes.

Machines tools houses are handling a nice volume of business. Deliveries are not improving, and business in some cases is booked now for February shipment. Prices are high, and they are going to stay high. War levels are quite common. This is creating quite a demand in some quarters for used machinery. Very often a customer wants a machine at once, and a used tool is all he can get. Then, again, there is a big spread in the price between the used and the new, although the price is not a determining factor in many sales.

The scrap yards are shipping little material now to United States points. The strike has tied up the yards there, and they are not taking shipments. Trade on that account is inclined to be a little dull, with coppers showing some weakness.

MONTREAL RELIEVED TO HEAR OF BRITISH STRIKE BEING SETTLED

Special to CANADIAN MACHINERY.

MONTREAL, Que., October 8.—The tension that was becoming more pronounced during the week, as a direct result of the industrial conditions in England, received a favorable reaction to-day, when it was learned that arrangements had been made whereby the men would return to work pending further adjustment of the differences between the men and the administration. The British situation was reflected here in the irregular activities in the harbor, and to some extent the export of produce and materials had been interfered with owing to the inability of shipping companies to guarantee unloading at the English destination, due to the congested state of the terminal docks. With this situation clearing attention is centered in the labor troubles in the States, but the serious nature of the American troubles is gradually fading, as the strike, so far, has had little direct effect in this district, although the influence is not conducive to expansion of activity.

While the general tendency is one of conservative trading, the business of the week has been quite normal. Some dealers have experienced a little difficulty in getting goods in from the States, but the reports for the past few days have been more encouraging. Steel business is not heavy, but a slight inconvenience is beginning to show itself in plates and tubes, the warehouse supplies in these lines having fallen off slightly during the past two weeks. One factor that prevents the situation becoming more serious is that the existing demand is below normal, and, so far, dealers have been in a position to fill all the requirements of the trade.

Lighter Tool Movement

Summing up the reports that are gathered from dealers it would seem that the movement in machine tools is not very brisk, and the demand is considerably less than for several weeks past. What little business is reported is going to a variety of industries and no special development appears in any direction. Circumstances combine to influence the buyer along conservative lines as existing conditions of labor and material costs are not those to induce cautious manufacturers to branch out into new or renewed activities. There are cases, however, that lead one to believe that many new enterprises would take on a larger sphere if industrial stability were more definitely assured. Inquiries seem to impress the trade in this connection. The supply market is one of nominal demand with little change in prices generally.

Listless Scrap Market

The movement of scrap is virtually at a standstill and the bulk of the trading is of a local character, foundries calling for regular supplies but in small quantities, the conservative nature of the buying indicating that little consideration is yet being given to other than immediate requirements. Old metals have developed a weakness but local quotations are maintained. Scrap iron and steels are quite firm but quiet. Cast iron is stronger, the quotation of $21 representing an advance of $1 per ton.

STRIKE EFFECT TO BE FELT HERE YET

Although, So Far Local Trade Has Been Able To Get Along With No Trouble

TORONTO—Trade generally does not like the continuation of the steel strike in United States. So far, nothing is suffering in this country, but it is only a matter of time until something will have to give. While it is true that probably sixty per cent. of the men employed at the steel mills are working—and that figure seems about right—it does not follow that production is sixty per cent. of what it was when the strike was called. There must be mills where men are kept on for the moral effect of keeping them on and there must be cases where production is away below the amount that might reasonably be expected from the number of hands on the premises.

In the Steel Trade

In a general way, it can be said that the steel trade is not suffering yet. It is a strange situation, but none the less a fact that the warehouses are better off than their customers. Warehouses take on standard sizes in everything, and in this way they can get more from the yards of the mills now than many of their customers who buy direct from the mills because their orders are all special and odd sizes. The factories, especially where much boiler and tank work is done, are in the same position as the man who gets his clothes made to order. Nearly every order they send out has to be made up for them, and now that capacity is away down it is only to be expected that there will be congestion and delay. As far as the warehouses are concerned it must be said that the American mills are making a brave attempt to give them service, as shipments of fair-sized tonnages are still coming over the line.

In a general way, sheet and plate are hard hit. This is especially in regard to sheets. There has been a big demand for sheets for some time back, and warehouses are not well supplied.

The tube mills in some cases are still shipping against recent orders and material is arriving this week. This is true of the lap weld, but the cold drawn are down for the most part. There is very seldom any stock at the mills. Tubes are sold nearly altogether through the jobbers, and the former protect the latter in nearly every case. Men generally buy tubes in small lots for repair jobs, etc. This country depends on United States for its supply, and that supply is in danger. Neither is there a good stock in the warehouses at present, while the demand is strong.

The Matter of Prices

As far as CANADIAN MACHINERY has heard, only one of the independent mills has intimated that it wanted an increase for delivery, and that was 20 cents per hundred premium on plates. None of the Steel Corporation mills want any higher prices than have been prevailing all along.

"Prices were due to stiffen in Canada, strike or not," stated one of the warehouse men to CANADIAN MACHINERY this morning. "For some time past there has been something close on to a stampede in certain places to get stock cleared out and turned into money. The end of the war left some firms with too big a stock and they were anxious to get out and turn it into ready cash. The way to do this was at a price. This at times took in sheets, and another time bars. These stocks have been reduced to the point where those warehouses must now follow the market. When they go in for more business they will first of all have to go into the market and they will then know exactly what they have to pay. This stampeded business has been pretty well cleared out, and stocks to draw from are low and may go lower if the strike lasts."

There were a good many rumors around for a while that plate could be secured, if one were to buy "hard" enough, for 2.50, rather than at the supposed price of 2.65. It may be that some plate did come to Canada at 2.50, but if so it was very small in tonnage, as dealers seem to have adhered all the way through to the 2.65 basis for quoting. Certain it is, that there is no chance for anything going across at 2.50 with the strike on.

September was a great month for some of the warehouses handling steel products, such as plate, sheets, tubes, shapes, etc. One of them told CANADIAN MACHINERY this morning that the month just closed was twice as large as anything that had been done this year, and from the looks of things the same firm expects that October will be quite as good, unless trouble at the mills gets at the point where no material can come through. Selling is not such a task as it was three months ago. In some respects it reminds one of the war days when all a salesman had to do was to intimate that he had certain lines of steel or machinery and he might be induced to dispose of them at a price.

The Machinery Market

There is a peculiar tendency in the machine tool market just now, and one that looks like more palmy days for the used machine. Deliveries on new tools are rather uncertain. Some that are booked no ware for February shipment, and very often a customer wants a machine right away. Well, when the price is considered and the chances of shipment, he naturally turns to the used machine market. There is business to be done here now, and it would be a good idea for those that have used machinery to advertise the fact, telling what they have.

The prevailing prices are high for new machinery, but salesmen say this does not interfere with sales at all. The big idea now in nearly every case is to get the machine suitable for the job that will turn out a lot of work and the price paid is not a great matter, because the buyer reckons he can get it out of the machine in production.

Supplies Are Brisk

Travelers for machine tools—small—are gathering in a lot of business just now from shops that are getting under way with production. The automobile business is responsible for a good bulk of the sales.

Many of the firms selling certain lines, such as cutters, claim that they are not getting the protection they should from the makers. In United States, they claim, customers can buy cutters at net, while the jobbers get ten per cent. off. Of course it is hard for the Canadian dealer to sell U.S. cutters, on account of the duty and other charges. But in Canada, cutters are now selling at ten off to consumers direct, and the jobber is practically wiped out, because it does not take long for purchasing agents to learn that a certain price is being quoted. It it all the more extraordinary that the Canadian consumer should buy at such a low figure when one considers that the market here is smaller than in the States, and duty must be paid on much of the material that is brought in to manufacture the articles in the first place.

POINTS IN WEEK'S MARKETING NOTES

The steel strike does not progress, neither is it broken. Production is not as large as might be expected from the number of men working.

—

In a general way the sheet situation threatens to become the worst by reason of the strike.

—

Warehouses are getting shipments of standard sizes from the mills, but firms wanting sizes rolled to order are not being served.

—

The demand for used machinery increases in some quarters. Reasons for this are deliveries on new tools too far distant for a man who wants a machine at once, and prices are at war levels, or even better.

—

Dealers in cutters claim they have "hard-going" under present conditions and terms of sale. U. S. buyers are paying more for cutters than Canadian purchasers.

—

Scrap sales are uncertain on account of the steel strike. No shipments are going across the border from Canadian yards.

—

Offices selling steel are certain there will be a great congestion of orders on the books, to be looked after when operations become normal.

Some of the representatives of Canadian plants were in session in Toronto a few days ago, concerning the matter of discounts, etc., but it is not known if anything definite was accomplished.

The Scrap Metal Market

Shipments from this side of the line are held up, as far as United States centres are concerned. Requests have been received not to send material on against contracts in some cases. This all tends to bring about a period of quietness in some sections of the scrap market, although there are some domestic sales being put through.

Coppers are not strong, although they have not been marked down. Still there is no marked desire on the part of buyers to take them on at present prices.

The item "shell turnings" has been dropped from the list of material quoted in this paper, as there is very little of this left in the country.

CANADIAN PLANTS NOT HURT YET BY THE UNITED STATES STEEL STRIKE

According to reports that have been received Canadian firms are getting along with no great inconvenience from the steel strike.

Fort William.—Locally, the United States steel strike is not making itself felt. At the Canadian Car and Foundry plant all the steel needed to keep things going is on hand, with the exception of one shipment, which is coming from Duluth and is now on its way here by boat. J. F. Paige, general manager of the Port Arthur Shipbuilding Company, says that they are feeling no effects from the strike as far as shipments of material are concerned. All the steel needed is now on hand and what is on order and is not yet received is from warehouse stock and will come forward, it is expected, in the regular way.

All Right in Sarnia

Sarnia. — The management of the Sarnia Bridge Company, probably the largest users of steel in the city, stated that they had a stock of steel on hand which would keep them going for at least six months. About ninety employees are at present engaged in bridge building, and from 500 to 600 tons of steel were used monthly. The company did not anticipate a shut-down and had no cause for alarm, and would continue to employ a full force.

C. H. Helby, of the Mueller Company, stated that he did not believe it would have any effort on their plant unless the strike continued a long time. The Mueller Company also had sufficient on hand to keep their plant in operation for some time. Mr. Helby said that the strike might cause a fluctuation in the price of material, but as far as the operation of their plant was concerned there was no cause for worry.

The Imperial Oil Limited purchase large quantities of steel, which is used in the construction of tanks and in various ways about the plant. With a large stock on hand, W. J. Gilchrist, the manager, stated that they could operate for a long time regardless of the steel strike. "It depends on the duration of the strike," said F. W. Gigax, of the Goodison Thresher Company. "We are well fortified and have enough steel in stock to last us until the first of February. Our company buys in large quantities and at present I see no cause for alarm." That the strike would not last very long was the opinion of Mr. Gigax.

The Doherty Stove Company, employing a staff of about sixty men, are fairly well fortified, and have sufficient steel to keep them going until about the middle of December, was the information given out by W. L. Doherty, of the Doherty Stove Company. "Fortunately we had some ordered and we received a shipment yesterday," said Doherty. "I do not anticipate any trouble as I am under the impression that the strike will be settled before our supply runs out," concluded Mr. Doherty.

Sherbrooke Conditions

Mr. A. G. Campbell, of the Sherbrooke Iron Works, took an optimistic view of the situation when questioned on the matter.

"At present," he said, "there will be no effect upon local industries, not at any rate on our plant. We have a sufficient supply of raw material to last us through a considerable period. If the strike should keep up for any great length of time I suppose it will have its effect, but I do not think the steel companies would have let the men go out unless they had on hand a large supply ready for shipment."

The McKinnon Steel Company said that they did not anticipate any trouble, at least for some time to come, and hardly thought that the strike would last for a sufficiently long period to have any great effect on conditions here.

"We have a large stock on hand which should last us through. If, however, the strike lasts for a long period, and our supply gives out, it will then result in the delaying of contracts, which will have a decided effect on industries here."

Mr. Newton, of the Canadian Ingersoll-Rand Company, said that no difficulty was to be expected, but that a continuation of the strike would have its effect in cutting down the supply of raw material.

ROLLS-ROYCE GOING TO BUILD THEIR CARS IN UNITED STATES

Special to CANADIAN MACHINERY.

NEW YORK, October 9—While the steel strike is holding up buying of machine tools in some lines of industrial activity, plans for industrial expansion, particularly in the automotive industries, go on without interruption. An interesting development is the prospective increase in automobile and tractor manufacturing in the East. The Willys Corporation, which recently purchased the plant of the Duesenberg Motors Corporation at Elizabeth, N. J., will more than triple the size of this plant, and within a few weeks will be in the market for considerable new equipment.

The Willys Corporation will manufacture at Elizabeth a new six-cylinder car, which, it is reported, will be sold at a price somewhere near $1,000. Production at the rate of 550 automobiles a day is being planned for.

Rolls-Royce in America

Another important automobile development is the plan of the Rolls-Royce Co. of England to build an American plant, which will in all probability be located in the East. Several plants used for war purposes are now under consideration and a selection will be made soon. The Rolls-Royce Co. has opened an office at 23 William Street, New York, and has bought used machine tools with which to begin initial manufacturing operations. Eventually its purchases of machine tools will run into large proportions.

Henry Ford & Son, of Detroit, manufacturers of tractors, have started work on a new plant on Green Island, in the Hudson River, near Albany, New York. This plant, when completed, will employ about 30,000 men and will turn out Fordson tractors for the export trade. Equipment probably will be bought at Detroit, although this has not definitely been made known yet. The expansion of the units of the General Motors Corporation will extend to the plant of the New Departure Mfg. Co., Bristol, Conn., which will be greatly enlarged. Quotations on several hundred machine tools are now being asked for. Total purchases for the New Departure plant will probably reach $1,000,000.

The Columbia Gramophone Co., Bridgeport, Conn., has plans for the construction of an additional manufacturing plant in the East, and will likely make an announcement soon.

The Export Business

In export trade there is a very fair amount of inquiry. It has been somewhat surprising that several large machine tools have been purchased for shipment to France, despite the disadvantage of about 60 per cent. in the exchange rate. The Cerro de Pasco Mining Co., New York, has purchased four cranes and is in the market for about 50 machine tools for shipment to its mines in South America. Another foreign inquiry is for an automobile

manufacturing plant in Japan, a list of about 100 tools having been put out by Shibakawa & Co., 120 Broadway, New York.

The National Machine Tool Builders Association will hold its annual fall convention at the Hotel Astor, New York, on October 15 and 16, and American machine tool export trade will probably come in for considerable discussion. One question agitating the trade is the extent to which foreign purchases should be financed here, and the methods of granting credits that should be adopted. It is stated that to secure much business in some of the European countries it will be necessary to grant one and two-year credits, and a plan may be discussed by which this can be done without overtaxing the financial resources of the machine tool companies.

SHEETS AND TUBES ARE THE MOST AFFECTED ITEMS BY STEEL STRIKE

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., October 9.—The iron and steel strike, now just in its third week, is running true to the form shown in the first four days, when, after increasing for a couple days, the strike began to lose ground slowly in the districts where idleness was in the minority and employment in the ascendency, while districts closed tight showed no disposition toward resumption.

It is a matter of intimidation, which means minority rule if the minority is of any size. Thus in Western Pennsylvania, where the strike did not get a good start, employment has been increasing so that the works that remained in some sort of operation are now running practically full, while of the few plants that closed entirely some have been resuming in the past few days. The Mahoning Valley, including Youngstown, also Cleveland, but not the nearby town, Lorain, remained closed tight during the first two weeks, as well as the Wheeling district, with the exception of a very few plants in that district.

There were predictions that this week some important resumptions would be begun in the Mahoning Valley, but full and authentic information is requisite before it can be accepted as positive that the district really is resuming. Men have been at work in some of the plants, doing odd jobs and being held as nuclei for such a general return of men as would permit of regular manufacturing operations being undertaken.

There is no question that the men have lost the strike, and in fact there was no question after the first three or four days of the strike. Too much capacity was left in operation for the idle districts to swing the active districts. It is a strike of common labor, chiefly ignorant foreign labor, ready for violence whenever and wherever there is an opportunity, and while no doubt the civil authorities are anxious to prevent disorder it is a difficult matter when mobs of hundreds or thousands may form. The common prediction is that general resumption can hardly occur in Ohio without the state militia having previously been called to the scene, but under the law the invoking of state aid cannot occur until there is an actual situation that the local authorities cannot handle, and the local authorities must admit the fact.

Production and Employment

The best estimate that can be made is that fully 40 per cent. of the workers in the iron and steel industry are idle. This is of the manufacturing industry proper, not including the Connellsville coke region, the lake or boats or the ore mines. The strike did not touch these activities at all and if they were included in the total the percentage of men idle would be a trifle lower.

Of the men idle it may be estimated that one-fourth desired beforehand to strike, that one-half, or double that number, really did go out as strikers when the time came, and that the other half comprise men who are idle because intimidated or because the strike was prevalent enough in the plants that employ them to make operation impossible. While the strike is distinctly a common labor or "hunky" strike it is not universally so. It is a fact that a few skilled and semi-skilled men did strike, and this was notably so in the case of one craft, the cranemen and electricians, who struck in considerable numbers.

Running or Closed

Geographically, as the strike was largely geographical and became wholly so during the first fortnight, the situation is as follows:

Eastern Pennsylvania is operating with scarcely an exception.

The large Cambria plant at Johnstown, at the western foot of the mountains, is closed entirely, as is the entire Lackawanna Steel Company property at Buffalo, together with part of the other operations there.

Western Pennsylvania is running nearly full, the chief exceptions being the Page and Pittsburgh steel and wire plants in Monessen, at the head of the Monongahela Valley manufacturing districts, a part of the city works of Jones & Laughlin and a few small plants here and there.

All plants in Cleveland, O., are down, but the Lorain pipe mill of National Tube Company is running very well.

The entire Mahoning Valley, in Ohio, is down, thus contrasting sharply with the other valley, the Shenango, just across the state line in Pennsylvania, which is running nearly full.

The Wheeling district, which has long been strong for strikes, is closed tight, except for two or three relatively minor plants.

In the Calumet district, Chicago and Gary, about one-third or thereabouts of the men are working, results being rather unsatisfactory.

Duluth, Minn., is reported working while the works of the Colorado Fuel & Iron Company at Pueblo are closed. Practically the whole south is working.

Production Suffers

While nearly, if not quite 60 per cent. of the men in the iron and steel industry are working, production, in point of tonnage, is not in altogether as high proportion, as there are works with light employment and still lighter production, operation being partly for moral effect. It being an issue upon which the manufacturers cannot possibly yield, the open shop versus domination by radical labor agitators and revolutionists, tonnage is not an item showing how the strike is going, employment being the item that furnishes the information.

The curtailment in output is more or less uniform in the different products, but there are variations. Plate capacity was so in excess of requirements that there is still an adequate or nearly adequate supply. There is nearly an adequate output of structural shapes. Tin plate production is less than half what it was averaging just before the strike, but as the canning season is over the restriction does not count for much. In wire products there is great restriction, but wire products are now largely out of season. In sheets the situation is very serious as sheets were scarce before the strike. The American Sheet and Tin Plate Company has been operating at least 72 per cent. of its sheet mills, seven of its plants being in full operation, but independents are averaging less than 50 per cent., so that sheet production as a whole is not over 60 per cent. of normal. On the whole, sheet plants making specialties, as for metal furniture and automobiles, are affected slightly less than mills making common sheets.

The Worst Item

By far the most unfortunate situation, from the standpoint of production and requirements, is that in pipe. While there was no abnormal demand, before the strike, for butt weld merchant pipe, there was a demand far beyond the supply for oil country goods, involving lap weld material, there being in fact an acute scarcity, so much so that many lessees, particularly in the Texas field, were likely to lose their leases through being unable to complete wells within the time limits they had injudiciously agreed to. The situation is, of course, greatly accentuated, for while the Steel Corporation is doing well in pipe, much more than half the independent capacity is down, including Youngstown Sheet

and Tube at Youngstown, La Belle at Steubenville, and Wheeling Steel and Iron at Wheeling. Mark at Chicago is producing little, while Spang, Chalfant and Company, Pittsburgh, were closed for a few days, though now operating moderately well. Of all the major independents, Jones & Laughlin alone have done well; National has its Riverside works; Wheeling, down tight, is operating full at Lorain, O., and moderately well at McKeesport, Pa., while one of its two Pittsburgh mills was down for a short time and is now operating only in part, the other city mill being reported in regular operation.

Steel mills report that their customers continue to show the greatest spirit of sympathy and co-operation and exhibit no tendency to bother them for deliveries, even though material may be badly needed.

PIG IRON TRADE

The strike has caused a demand for spot iron, and also the withdrawal of most of the offers of 1920 iron. The enquiry for iron for 1920 shipment is increasing steadily, and customers are asking for notification as soon as makers can supply them. Following are reports from various U. S. points:—

Boston. — New England conditions have been affected by the strike, a large falling off in sales having resulted. Offers of 1920 iron on this market have been almost entirely withdrawn. Furnaces in Eastern Pennsylvania have not been affected.

New York—While enquiry for 1920 delivery is increasing, furnaces are not taking any orders as yet. They are waiting until the strike has come to an end before committing themselves. Most of the business done has been in foundry iron for immediate delivery and nearby shipment.

Pittsburgh.—Foundry grades are supplying the only business in this district. Some of the steel makers whose stacks are banked through want of common labor are said to be looking round for basic and bessemer Enquiries for 5,000 tons foundry iron are reported by one maker.

Cleveland.—The strike has caused brisk demand for spot iron, and premiums have been paid for this class of business. Southern Ohio iron has been sold for the equivalent of $32.25, delivered, which represents a premium of $2 to $3.50 over the market. Car shortages are causing difficulty in delivery. There has been a small amount of 1920 business placed.

Cincinnati.—Foundry iron for immediate shipment to nearby points is finding a ready sale. Territory usually supplied by lake furnaces is being sold from here. Spot iron is commanding $28, and next year's iron seems to have been placed at a minimum of $30.

St. Louis.—Foundries and mills are operating pretty much as usual in this district, the strike not having affected them much. The demand for prompt shipment iron is better than has been the case for a long time. 1920 orders are not figuring in the business closed.

Birmingham.—Production in the south is increasing. The attempt at a strike of southern iron and steel workers proved abortive. Prices are firm on a basis of $28 for No. 2 foundry, and there is a steady demand.

Chicago.—Merchant stacks are completely tied up, and although melters are pretty well supplied for their immediate wants, prompt iron from east and south is being readily bought. This iron is bringing higher prices than has been paid for local iron, due to it being already on cars, ready for immediate movement.

U.S. SCRAP METAL

The scrap market is marking time, and while some districts report a better demand, in others buying is at a standstill. Following are reports from U. S. points:

Chicago.—While scrap suitable for open hearth mills is not moving, rerolling rails and rolling mill grades are in better demand. The strike having affected pig iron deliveries, foundries are taking all the cast iron scrap they can get. Railroad offerings are small.

Boston. — Although heavy melting prices are low, dealers are not buying. There is no demand from steel makers for grades used by them. Machinery No. 1 scrap has receded from the high level of last week but is still in strong demand.

New York.—With trading very light, the tone of the market is becoming a little firmer. The best demand is for borings, turnings and cast scrap. No. 1 heavy cast is quoted at $21.50 to $22, and No. 1 machinery cast at $22.50 to $23.

Philadelphia.—The strike has affected the scrap business, but demand for most grades is improving. Rolling mills have been looking for railroad wrought, but in heavy melting and similar grades there is little doing.

Pittsburgh.—There is little doing in any grades, and prices may be looked on as nominal. What movement there is is in foundry grades. Steel manufacturers are asking for suspension of shipments against contracts.

Buffalo.—Scrap dealers are sitting down and waiting for normal times to come again. Few mills are operating and these seem to have enough stock to carry them on. With all the handicaps, prices continue firm.

Cleveland. — There is practically a total cessation of activity in the scrap business here. Not for years have things been as dull as during the past week. Prices remain unchanged, for the reason that there has been no sale to change them.

Cincinnati.—There is in this district also the "nothing doing" sign displayed. A little foundry scrap has been moved, but otherwise the market is lifeless.

St. Louis.—No trading and a decidedly pessimistic feeling is prevalent in the market here. Mills have not been directly affected by the strike, but there is so much uncertainty that every one is waiting for developments.

SETTLEMENT OF CANCELLED CLAIMS IS NOT PROCEEDING VERY RAPIDLY

By Resident Correspondent.

OTTAWA.—Jos. Archambault, member for Chambly-Vercheres, had some interesting questions on the order paper this week, but he did not get a chance to put them. The Speaker appeared to be under the impression that they were not permissible as not being so much questions as statements. Mr. Archambault therefore temporarily withdrew them, though he protests that he does not see how they could be put in any other form to convey the data for the information he requires, and will consult an expert on procedure before returning to the endeavor to secure information.

The questions were as follows:

1. Is the Government aware that the War Secretary of the United States, Newton D. Baker, has appointed two American officers, called Assessors for the Canadian Contracts, to sit on the Imperial Board of Munitions and concur in the decisions of the said board in the settlement of the claims of Canadian contractors with the Government of the United States?

2. Is the Government aware of the predicament of the Canadian contractors by the fact that about $15,000,000 of these claims, consisting in disbursements and damages is not paid to them, although the Board of Imperial Munitions has declared and judged these claims to be just and reasonable, the recommendation of payment being stopped because the American officers do not concur in the award of the Imperial Board of Munitions, and would like to settle with the Canadian contractors at 50 per cent. discount?

3. Is the Government aware of the fact that, notwithstanding that the offer of the American officers is found unjust and unreasonable, the Imperial Board of Munitions refuses to come to the aid of the Canadian contractors in giving their decision to the Secretary of War of the United States, and for some unexplainable reason they advise the Canadian

SETTLEMENT OF CANCELLED CLAIMS

Continued from page 286

contractors to accept the offer of the American officers?

4. Is the Government aware that the large amount of $15,000,000 which is kept back since nearly 11 months is equivalent to a loan to the United States, and that its unjust retention threatens to ruin certain Canadian industries?

5. Is it the intention of the Government, in view of these facts, to leave their constituents at the mercy of these two American Officers, or are they not of the opinion that they should intervene immediately to the Imperial Board of Munitions to force them to protect the Canadian contractors and to report forthwith their decision to the Secretary of War, Baker?

The questions would form the basis for a speech in the House, in all probability, in which it is said Mr. Archambault would point out that Canadian munition manufacturers are being sacrificed by the Munitions Board, and it is more than likely that Sir Joseph Flavelle, of that board would be brought into the matter and have the blame laid at his door. The complaint voiced by the member for Chambly is that Sir Joseph Flavelle agrees that the claims of the Canadian manufacturers against the United States is just and reasonable, but that he refuses to become its active advocate and advises them to settle rather than go to law, whereas if he exerted his influence, as he might reasonably be expected to do, a settlement would easily be effected. It is also claimed that the American officers concerned do not represent the views of their Government, but are merely trying to secure little personal kudos by squeezing the Canadian manufacturer.

If Mr. Archambault can get past the Speaker with his question in some other form, the whole matter is likely to come up in the House.

Sir Joseph Flavelle does not care to speak for publication, beyond saying that he considers "substantial justice" is being done to the claims. There were some 330 of these, and but 25 remain. But in these 25 there is an amount involved greater than in the 305 that have been settled.

Having Some Difficulty

The statement has been made that in some cases the manufacturers are urged by their bankers to take what they can get, even a fifty per cent. settlement. CANADIAN MACHINERY discussed this with the financial man of one firm that had large contracts cancelled. He admitted that there had been considerable trouble from the start in the making out of the claims. This work had to be done over to meet certain requirements insisted on by the Ordnance Department. As to the work now, there is no fifty-fifty settlement basis. Items are either thrown out or conceded. "The trouble is," continued our informant, "the representatives of the U. S. Ordnance Department do not understand the situation as did the late Colonel Albee, who had charge of the U. S. office here during the period of manufacture. He knew just what was being done to speed up the production of munitions, and was thoroughly familiar with each plant that had a contract from Washington. His removal by death has been a serious matter for the Canadian manufacturer. The men in charge now know only the details of making a settlement, and little or nothing of the conditions that existed during the turning out of the material."

CANADIAN MANUFACTURERS ON A TRIP TO THE MARITIME PROVINCES

Special to CANADIAN MACHINERY.

ST. JOHN, N.B.—A party of members of the Canadian Manufacturers' Association has been visiting New Brunswick and has been well entertained in Fredericton, Moncton and St. John. They were received by civic officials and manufacturers and conducted on motor trips about the cities, visiting objects of interest and manufacturing plants, and being honored with banquets in different places. In the party were: T. P. Howard, of the Phoenix Bridge and Iron Works, Montreal, president; W. S. Fisher, Emerson and Fisher, Ltd., St. John; W. H. Shapley, Sterling Action and Keys Ltd., Toronto; J. T. Cumming, of Jas. W. Cumming & Son, New Glasgow, N. S.; A. D. Ganong, Ganong Bros., St. Stephen, N.B.; R. H. McKay, of McKay & Fraser, New Glasgow, N.S.; G. W. Fleming, Phoenix Foundry, St. John, N.B.; H. R. Thompson, secretary Maritime division, C.M.A., Amherst, N.S.; J. T. Stirrett, general secretary, C.M.A., Toronto; J. R. K. Bristol, manager tariff department, C. M. A., Toronto; J. E. Walsh, general manager, C.M.A., Toronto; Joseph Picard, of the Rock City Tobacco Co., Ltd., Quebec; F. W. Stewart, Cluett, Peabody & Co., Montreal; P. E. Joubert, Lamontagne Ltd., Montreal; G. W. McKinnon, McKinnon Steel Co., Sherbrooke; M. R. Meldrum, Herbert Morris, Crane and Hoist Co., Niagara Falls; G. H. Douglas, Thornton & Douglas, Hamilton; H. W. Fleury, J. Fleury's Sons, Aurora; H. A. Telfer, Telfer Mfg. Co., Toronto; S. Harris Lithographing Co., Toronto; A. L. Fowler, Fowler Milling Co., St. John; C. S. Christie, Christie Woodworking Co., St. John; R. A. McAvity, T. McAvity & Sons, St. John; Lewis Connors, Connors Bros., St. John; Cheslie Peters, C. H. Peters Sons, St. John; A. L. Foster, T. S. Simms & Co., St. John; J. D. Palmer, Hartt Boot & Shoe Co., Fredericton; W. F. Knoll, James Pender & Co., Ltd., St. John; Alex. Wilson, Wilson Box Co., St. John; W. A. Christie, Christie Bros. & Co., Amherst, N.S., and R. E. Dickie, Stewiacke, N.S. All these were present at a banquet tendered in the Union Club, St. John, during the visit of the outside members.

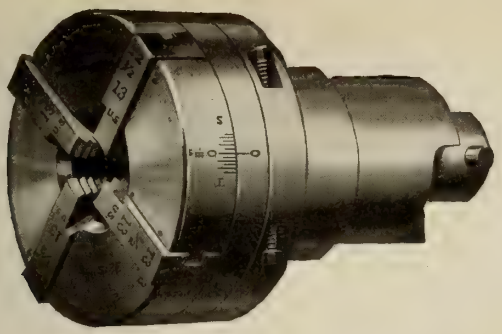
It is expected that much good will follow from a trading and industrial viewpoint from the visit of the Upper Canadian manufacturers to these provinces. At the first day's gathering in St. John, many matters of interest were discussed and among the keynotes sounded were that there was an awakening of a broader spirit of friendlines between the manufacturers of Canada, East and West, and that the people of Ontario and other provinces should visit the East more frequently with the idea of a fuller study of problems existing here in order that industry might benefit and the future expansion of the Dominion be promoted. One of the chief objects accomplished by the gatherings in Fredericton, Moncton and St. John, was that local representatives were brought in more intimate association with those from the head offices for the discussion of mutually important questions, previously done by mail. The gathering was so arranged as to time with the meeting of the Maritime Province division in St. John.

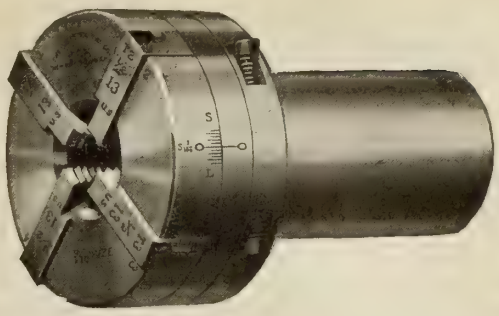
The delegates were welcomed to the city by Mayor Hayes and R. B. Emerson, president of the Board of Trade. In the afternoon they were taken for a cruise around the harbor in ideal weather, while in the evening the banquet already referred to was held at the Union Club, at which Mr. Fisher presided. He made an opening address in which he referred to the importance of the association from the viewpoint of the Canadian manufacturer, and urged the extension of its activities to promote Canadian business and to bring about a greater growth of industry.

The sessions of the Maritime Manufacturers' Association held in St. John, were presided over by R. H. McKay, New Glasgow, N.S. One of the chief features discussed was the development of power in New Brunswick and Nova Scotia. It was the general opinion that steps should be immediately taken in harnessing the water power of both provinces and conserving the coal supply. Committees were appointed to investigate the matter and take up with the respective legislatures the development of power.

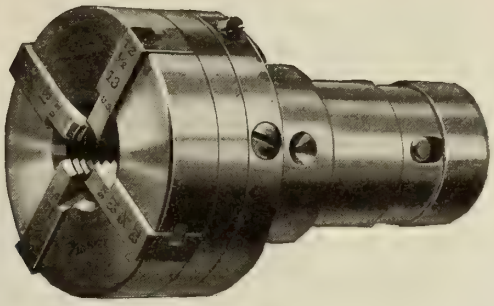
Lewis W. Simms, president of T. S. Simms & Co., St. John, returned home this week after a visit to Oklahoma, where he was buying stock.

Philadelphia.—Furnaces are still unwilling to quote on next year iron. Makers having iron on stock are due to the strike situation, are able to get from $29 to $30.25 for No. 2X iron. Fair business in foundry iron is being done. The basic situation has been changed due to large purchases of this grade by a large interest, which closed orders for 45,000 tons at an average rate of $27.50 delivered Pencoyd.





Geometric Solid Adjustable Die Heads



When one uses the word "ONLY," he needs to be sure of what he is talking about. With confidence we use the word in saying that a Geometric Solid Adjustable Die Head, fitted with a set of milled dies, is the only solid die head that will back off without stripping the thread.

Geometric Solid Adjustable Die Heads may be fitted with either a releasing shank, plain shank, or with special shank for the Gridley Automatics. The releasing shank permits the head to disengage from the shank upon completion of the thread. The plain shank fits the head for use on the turret of a lathe or on a live spindle, such as a drill press.

Apart from the fact that it is not equipped with the self-opening feature or the roughing and finishing attachment, the Geometric Solid Adjustable Die Head is the same in principle and construction and will do equally as accurate work as the other styles of Geometric Die Heads.

Whatever the requirements, there is a type of Geometric Die Head best adapted to the work.

MONTREAL NOTES

At the October meeting of the Canadian Railway Club, which will be held at the Windsor Hotel on the evening of the 14th, the subject will be Competition, Combination, and Co-operation, and will take the form of a lecture by Major S. T. Robins, general manager of the Dearborn Chemical Company.

* * *

Following a shut-down of nearly a month, the Sydney plant of the Dominion Iron and Steel Co. has commenced operations on single shift, and it is anticipated that regular work will be resumed in the very near future. For some time prior to the closing down of these works the orders had been falling off, and economic operations of the plant was deemed impossible.

* * *

Preferential consideration in the high cost of living is granted to few. Owing to the increased cost of operation and maintenance the Montreal Chambre de Commerce has practically decided to amend the constitution, to raise the admission fee from $5 to $10, with a similar advance in the annual fee for active members, and to corresponding members the fee will be $5 in place of $2, as formerly.

* * *

Substantial gains have been made in the grain shipments through the Lachine Canal, for the month of September, over that for the corresponding month last year. The figures are 3,604,638 bushels, this representing an increase of over two millions over September of last year. Two-thirds of the grain shipped was in wheat, the total being 2,155,254 bushels. So far this year the grain passage through the Canal has been close to 18,000,000 bushels.

* * *

J. M. Rosevear, who has been general auditor of the Grand Trunk and Grand Trunk Pacific for the past year, has been appointed comptroller of the company, superseding W. H. Ardley, retired. Mr. Rosevear entered the services of the Grand Trunk in 1897 as a clerk in the office of the auditor of disbursements. He was appointed travelling accountant in 1904, and chief clerk in 1906. He was appointed auditor of disbursements for the entire system in 1908, retaining this position for ten years.

* * *

Winter regulations are now effective in the port of Montreal. On the first of October the "winter mark" ruling came into force, so that vessels will carry less cargo than during the summer months. This is necessary owing to the heavy weather that may be encountered from now on. On ocean-going vessels there are three marks, showing to what depth a vessel may be loaded; one for summer, one for fall and one for the winter season, the last allowing for the lighter cargoes.

While no definite announcement has been made, it is learned that P. Lyall and Son of Montreal will shortly engage in the manufacture of automobiles. For the past year the engineers of the company have been designing and experimenting on a new type of internal combustion engine, and, according to official statements, tests have been made that establish its superiority over similar engines now in service. The post-war activities of this company also include the perfection of a special chuck for general industrial purposes, a product that has been developed from those designed and constructed by the engineering staff during the war.

* * *

The practice of coaling Transatlantic steamers on this side, for the return trip, has become additionally pronounced during the past couple of weeks, owing to the serious character of the industrial situation in England. However, this condition will probably be remedied in the near future, as the latest reports are to the effect that an agreement has been reached between the striking railroad men and the Government, whereby they will return to work while negotiations are carried on. For some time past the congestion of the docks on the other side have become so great that restrictions in shipping have been very necessary. From now on it is expected that relief will be shown in this connection.

* * *

J. W. Norcross, president of the Canada Steamship Lines, has recently returned from Europe, and is very optimistic regarding the shipping activities, both of this and other countries. He states that British and French shipping interests anticipate a period of several years of continued favorable conditions as exist at the present time. Of his own direct interests Mr. Norcross stated, "Developments that have already occurred in the Atlantic business of the Canada Steamship Lines have more than justified this, and important extensions and improvements are now being contemplated." He looks for considerable emigration from the British Isles to Canada during the coming year, and appreciates the fact that shipbuilding and industry in general will greatly benefit by the additional skilled labor that will be available.

* * *

Some idea of the changing conditions that are taking place in world commerce may be gathered from the export of coal that has recently taken place from this country. While this state of affairs is largely due to the recent attitude of British labor, there is nevertheless a possibility that trade of this kind may be permanent in character. The steamer Ariant, recently arrived at Halifax with a general cargo, has been diverted from her regular activities and will take on a cargo of coal at Sydney for the United Kingdom. Another instance of coal trading is the shipments of fuel that are now going to Holland. Some time ago the Netherlands Government obtained some 90,000 tons of Canadian coal, and and it has been announced that the Dutch Government are so well pleased with the quality of the coal that a further order for upwards of 200,000 tons has been placed.

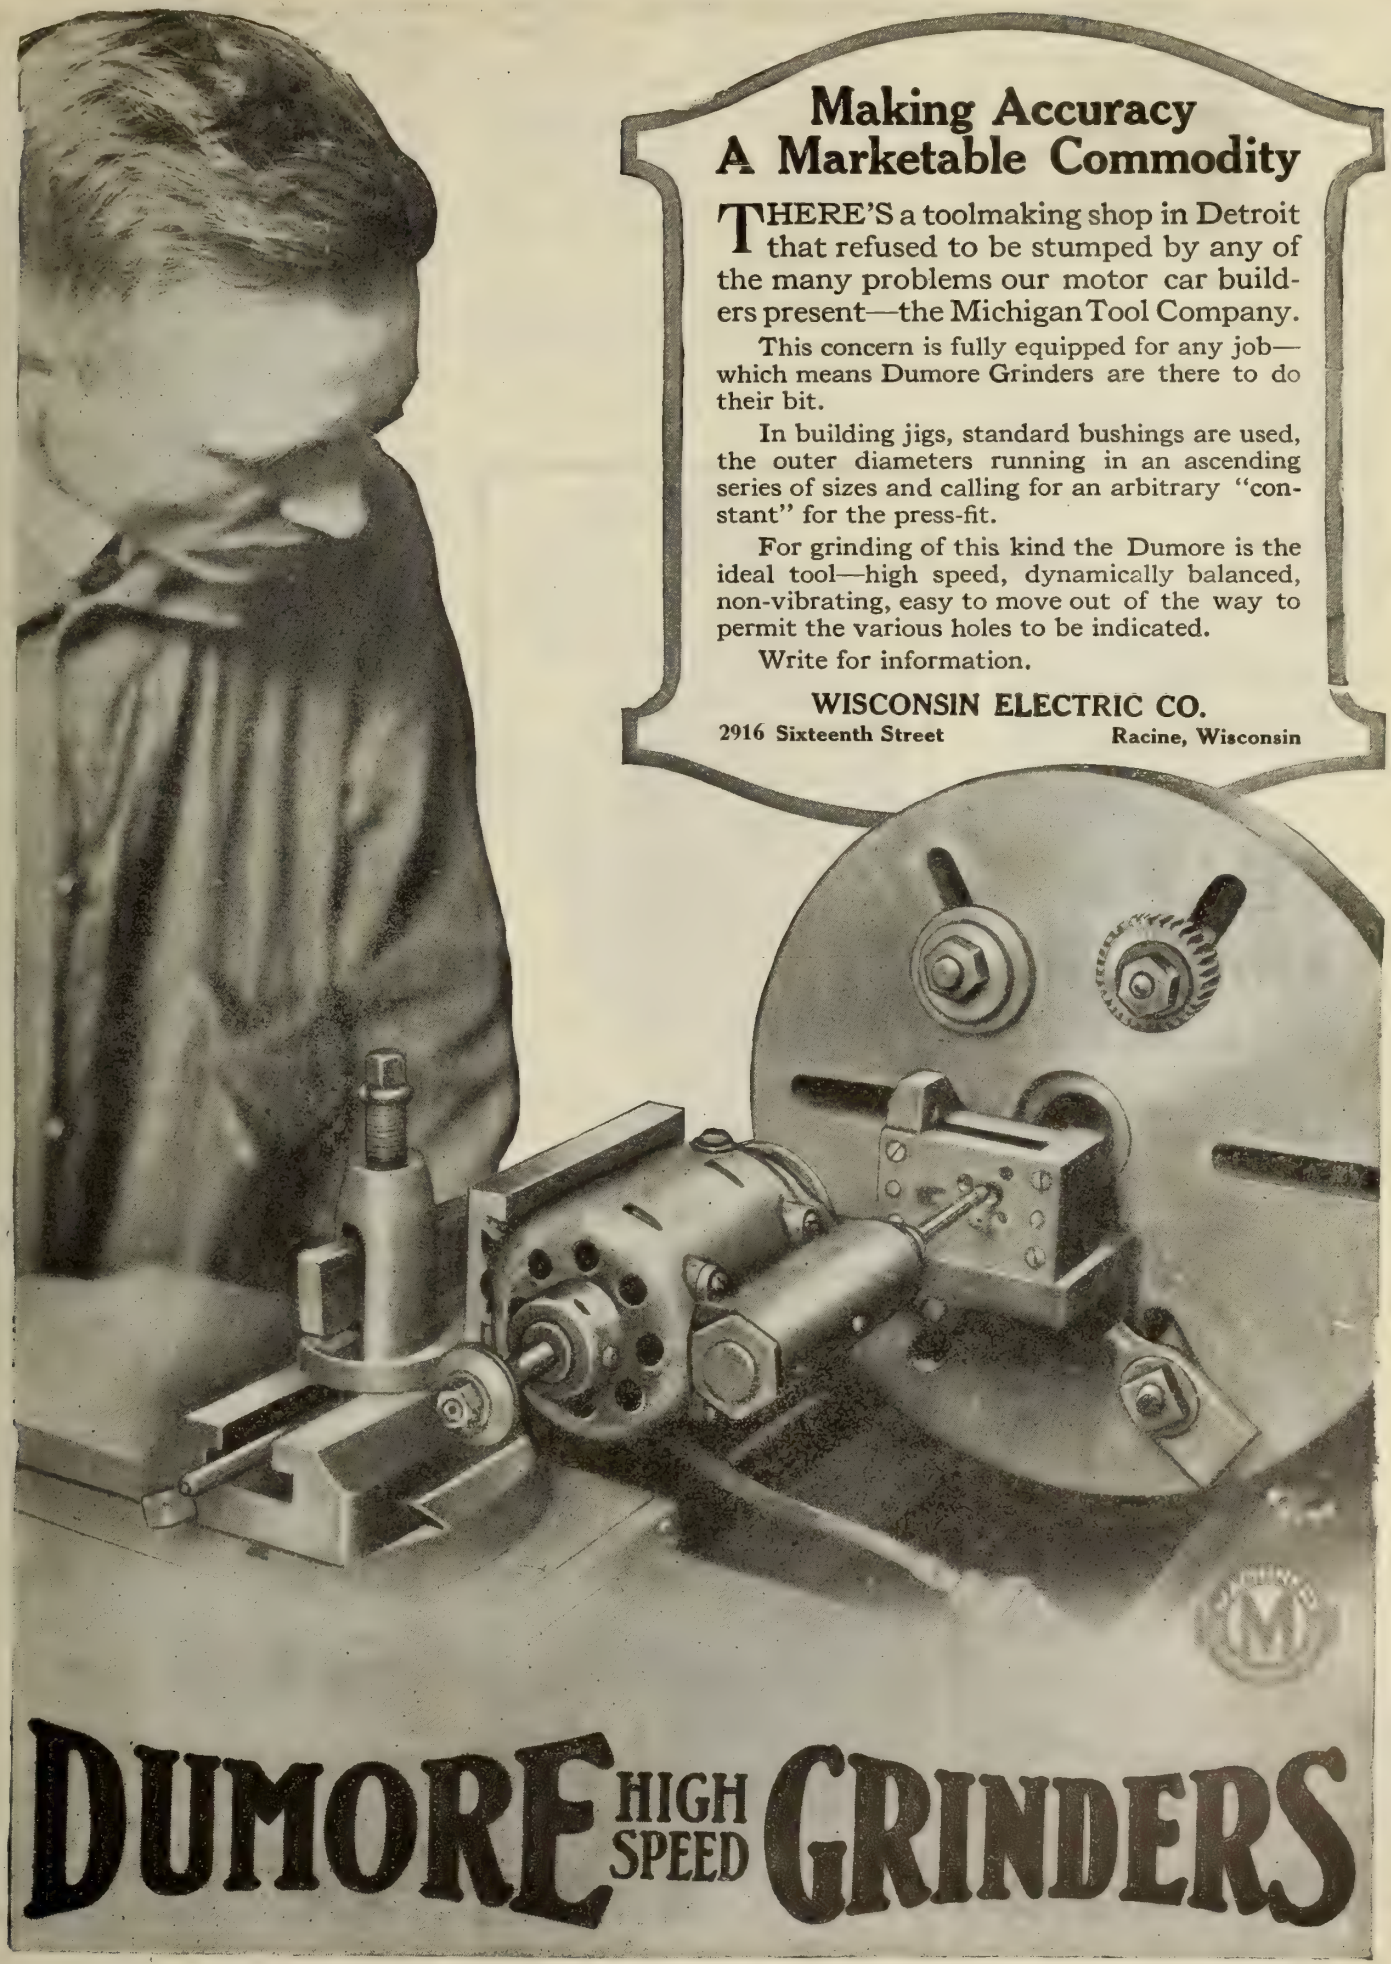
AMERICAN BUREAU OF SHIPPING APPROVES THERMIT WELDING FOR MARINE REPAIRS

An important development of Thermit welding in American shipyards is anticipated by the recent approval by the American Bureau of Shipping of the Thermit process for welding stern frames, rudder frames, and other heavy sections on ships registered under their classification. The only qualification is that this bureau be notified sufficiently in advance to have a surveyor in attendance during the welding operation as well as to inspect and test the weld when completed.

While the Thermit process has been used since 1903 for making marine repairs, and has had a great many successful welds of this nature to its credit, the process was never officially approved by the American Bureau of Shipping, and most of the repairs were made on vessels not classed by them. It is due entirely to the unbroken record of successful marine welds that the bureau now accords its official sanction to the process. According to a statement by the Metal & Thermit Corporation, there has never been a single failure of a Thermit marine weld so far as it has been able to ascertain in all the years that the process has been used under this company's jurisdiction.

Now that the United States promises to have one of the largest mercantile marines in the world, and as practically all of the ships which have recently been constructed, and which will be constructed in the future, will be registered with the American Bureau of Shipping, the recognition of the Thermit process by that bureau bids fair to result in many important Thermit marine welds from now on.

Fire at Ingersoll.—Damage was caused by fire to the roof of the moulding shop of the T. E. Bissell factory. The fire started near a small cupola, the roof of which, as well as the centre section of the moulding shop, was completely destroyed. There had been a heavy cast in the moulding shop in the morning, but the moulders had the afternoon off. The fire had evidently been smouldering for some time before it burst through the roof and was discovered. The loss will probably exceed $2,00, while the delay of several weeks which will necessarily follow will also be serious, as the firm has large orders which will keep the moulding shop running for several months. The building is owned by the John Morrow Company, and the loss is covered by insurance.



Making Accuracy A Marketable Commodity

THERE'S a toolmaking shop in Detroit that refused to be stumped by any of the many problems our motor car builders present—the Michigan Tool Company.

This concern is fully equipped for any job—which means Dumore Grinders are there to do their bit.

In building jigs, standard bushings are used, the outer diameters running in an ascending series of sizes and calling for an arbitrary "constant" for the press-fit.

For grinding of this kind the Dumore is the ideal tool—high speed, dynamically balanced, non-vibrating, easy to move out of the way to permit the various holes to be indicated.

Write for information.

WISCONSIN ELECTRIC CO.

INCORPORATIONS

The Abrasive Company of Canada, Limited, has been incorporated under the Ontario Companies Act with a capital stock of $250,000 divided into 2,500 shares of $100 each, to manufacture grinding wheels, bricks, sticks, and refractories, and to mine bauxite minerals and coal. The head office to be in Hamilton.

MARINE

Port Arthur.—The largest grain cargo ever carried on the Great Lakes was cleared for Port McNicoll in the W. Grant Morden, a Port Arthur-built vessel. The cargo consisted of 503,153½ bushels of wheat, the value of which was $1,150,000.

Vancouver.—The steamer "War Melody" has been purchased by the Robert Dollar Company and renamed Grace Dollar. She is now loading coal at Norfolk for San Francisco. She is expected to leave San Francisco for the Orient under command of Captain Abernethy about October 20.

Sault Ste. Marie.—The large Sabin lock on the Soo Canal was opened with appropriate ceremonies on Sept. 18th. The new lock cost $3,000,000, and was six years in building. The addition of this lock brings the total number up to five, four American and one Canadian, and these locks together are capable of handling any fleet that may assemble at the St. Mary's river.

St. Thomas.—A new steamship service has been inaugurated between Cleveland and Port Stanley, by the Pere Marquette No. 8, a combined passenger and freight steamer. She will be operated by the Cleveland Erieau Steamship Co. and will give a tri-weekly service. She has accommodation for 60 passengers and large freight capacity. The service will be continued until December 1.

New York.—The White Star line has been allotted the former North German Lloyd liner Prinz Frederich Wilhelm, and will use her on the New York, Cherbourg and Southampton route. She has been in use for repatriating American troops, and was blockaded in Hamburg during the war. The reparation committee of the Inter Allied council at Paris assigned the vessel to the British Government, who in turn advised the White Star line to take the vessel.

Watertown, N.Y.—The barge Hilda, owned by the Montreal Transportation Company, which parted company with the tug Thompson during a heavy gale in Lake Ontario Wednesday, the whereabouts of which has been a mystery since she separated from the tug, has been located ashore at Stony Point, four miles from Henderson Harbor. The Donnelly Wrecking Company of Kingston, Ontario, is to-day at work trying to release her. The Hilda has seven feet of water in her hold. She is loaded with 35,000 bushels of wheat, and was bound from Buffalo to Montreal.

TRADE GOSSIP

New Building for O. A. College.—P. H. Secord & Co., of Brantford, Toronto, Hamilton and Brantford, have secured the contract to erect the new apiary building at the Ontario Agricultural College. The building will be of brick with stone foundation and will cost $40,000.

Company Gets Notice to Move.—The Corporation of Windsor have served notice to vacate city property on the Lamb Railway Service Corporation. The ratepayers recently voted against granting the company a bonus, including the purchase of land in the factory district. The company, who expected a favorable vote, had already commenced the erection of the factory.

Tin Plate in Demand.—There is a large demand for tin plate in Japan and it is necessary to import the product as it cannot be produced profitably in that country. Most of the plate was imported from the United States, and in 1916 amounted to 65,000 pounds. It dropped in succeeding years to 45,000 pounds, but since the signing of the armistice the imports have not been sufficient to supply the demand.

Ferro-Chrome in France.—The following statement regarding the production of ferro-chrome in France has been received from the office of the Commissioner General of Canada in France. Having received a letter asking what market there would be in France for Canadian ferro-chrome, inquiry was made. The Ministere de la Reconstitution Industrielle (Direction des Matieres Premieres), 74 Avenue des Champs-Elysees, Paris, made the following statement: "I beg to inform you that France has always been an exporter of ferro-chrome, both ordinary and refined, the production of its factories greatly exceeding the national consumption. Our electro-metallurgical works also manufacture the other ferro-alloys (tungsten, molybdenum, nickel, etc), in sufficient quantities."

Machinery Requirements of Poland.—A recent bulletin of the Polish Commercial and Industrial Bureau in New York, contains some detailed data relative to the approximate quantities of agricultural machinery urgently needed in Poland. The Bureau hopes to arrange loans and credits to meet the purchases of raw and manufactured materials which Polish importers and the Polish Government expect to make in the United States. We print below the data referred to above: Tractors, 1,500, with repair parts and suitable repairing tools; ploughs, 150,000, suitable for a light soil; harrows, 3,000, complete, of iron, also iron parts for 15,000 more to be made of wood; rollers, 500, with discs, also sufficient iron rollers to be used for construction of wooden framed rollers; sowers, 3,000, complete (1,000 each for motor, horse, and hand operation); cultivators, dusters, rakes, diggers of all systems—3,000; hay mowers, 6,000; hay baling machines (150 motor and 900 hand driven); ordinary harvesters, 6,000; binders, 3,000; threshers, 750 (steam driven), 1,500 (gasoline driven), 3,000 (horse driven); separators and blowers, with sufficient number of reserve sieves, 3,000, also metal parts for the construction of 3,000 additional blowers, to be made in Poland; corn graders of various types, 1,000. Scythes, sickles, whetstones: Scythes, 300,000; sickles, 150,000; whetstones, 300,000. Small tools: Hoes, 300,000; picks, 150,000; shovels, 300,000; spades, 300,000; axes, 150,000; mattocks, 50,000. These should be of various sizes and without handles. Heavy wagons for oxen and horses; iron tires, etc., for 300,000 wagons and ready-made wheels for 30,000 wagons. Sprays, bellows, sulphur, copper and rafia: Sprays, 90,000; bellows, 15,000; sulphur, 700,000 pounds; copper sulphate, 1,200,000 pounds; raffia, 1,200,000 pounds. Axes of various sizes, 18,000. Handsaws (both rip and cross-cut saws): 55-inch, 300; 60-inch, 3,000; smaller, 3,000. Files of different sizes, 1,200 dozen; rasps of different sizes, 1,500 dozen; spike hammers (41-lb.), 1,500 units; hammers (8-lb.), 1,500; picks, 3,000; shovels, 400; spades, 900; hoes, 900; chains, 600; large chains with spike and hooks, 150.

Welding and Cutting Apparatus

Canadian Rights for Sale Covering Well-Known and Profitable Oxy-Acetylene and Oxy-Hydrogen Welding and Cutting Equipment.

An excellent opportunity is offered to established brass manufacturing shop or a small manufacturing company to be organized to produce in Canada complete line of welding and cutting apparatus.

This equipment was placed on the United States market early in 1918, is fully protected by United States patents, and Canadian patents have been applied for within the required time.

Already being sold in Canada to an extent which will insure success of Canadian manufacturing company. Can be handled either direct or through jobbers. Net profits very large.

Patents, complete blue prints and specifications of entire line, as well as initial services of designer and inventor, may be obtained at a reasonable figure.

Is the Alien a Menace?

IN the October issue of MACLEAN'S MAGAZINE a strong presentation is made of the reason why the people of the West are against further foreign immigration.

"The Menace of the Alien" depicts the foreign problem in the Canadian West as it exists to-day, and shows every one of us why we must Canadianize our Ruthenians, Austrians, Slovaks, and our fifty-seven other varieties before we allow any further "unrestricted" immigration.

This article is written by a member of MACLEAN'S MAGAZINE staff who has just returned from a careful, personal investigation of the situation. Shall we have a "White West?" Many Westerners are demanding it. Are the aliens to swing labor into the bosom of the O.B.U.? It is being done—and what must we do to stop it?

The "inside" story of the routing of the Drumheller miner aliens by returned Canadian war veterans is here told by MACLEAN'S for the first time. What leadership must be substituted for the O.B.U. leadership of these foreigners?

The October issue of MACLEAN'S is a Western number in the sense that it contains many articles and stories of distinctly Western interest. For instance:

X "Those Pesky Farmers Out West"

By Hopkins Moorhouse, Author of "Deep Furrows"

They have completely upset the old order of things. No longer will politics consist of the comfortable fight between the Ins and Outs with the old party lines maintained. The grain growers on the Prairies have upset the calculations of the professional politicians and completely changed the face of Dominion politics.

X "Fifty Years in the West"

By Professor W. T. Allison

A breezy and readable sketch of the business career of Winnipeg's veteran business man, James H. Ashdown.

"Further Discoveries of New Land"

By Vilhjalmur Stefansson

The final and most interesting instalment of Mr. Stefansson's story of his wonderful trip of five years' duration in the Canadian north in which he tells for the first time of finding new continents in the Arctic and hoisting there the Canadian flag.

X "The Banshee Bell"

By Edith G. Bayne

A bright love story laid in the mountains of British Columbia.

Other Splendid Features of October MacLean's

X "The Turmoil at Ottawa"

By J. K. Munro

A comprehensive survey of Dominion politics, written with complete impartiality and absolute candor. It is bright and breezy, with a knock in every line for the politicial opportunists. It plucks many tail feathers from our party leaders.

"Spanish Doubloons"

By Camilla Kenyon

The start of a bright and fascinating serial story by a brilliant young writer. It is the Spanish Main brought up-to-date, treasure hunting with a background of fun and romance.

"The Airy Prince"

By Arthur Beverley Baxter

A complete novelette in which is presented a bird's-eye view of England in time of war. It is one of the most brilliant stories that has been written of recent years.

"His Majesty's Well-Beloved"

By Baroness Orczy

The latest novel by this popular authoress appearing exclusively in MACLEAN'S.

"Ebb and Flow"

By C. W. Stephens

A strong business story laid in the province of Quebec.

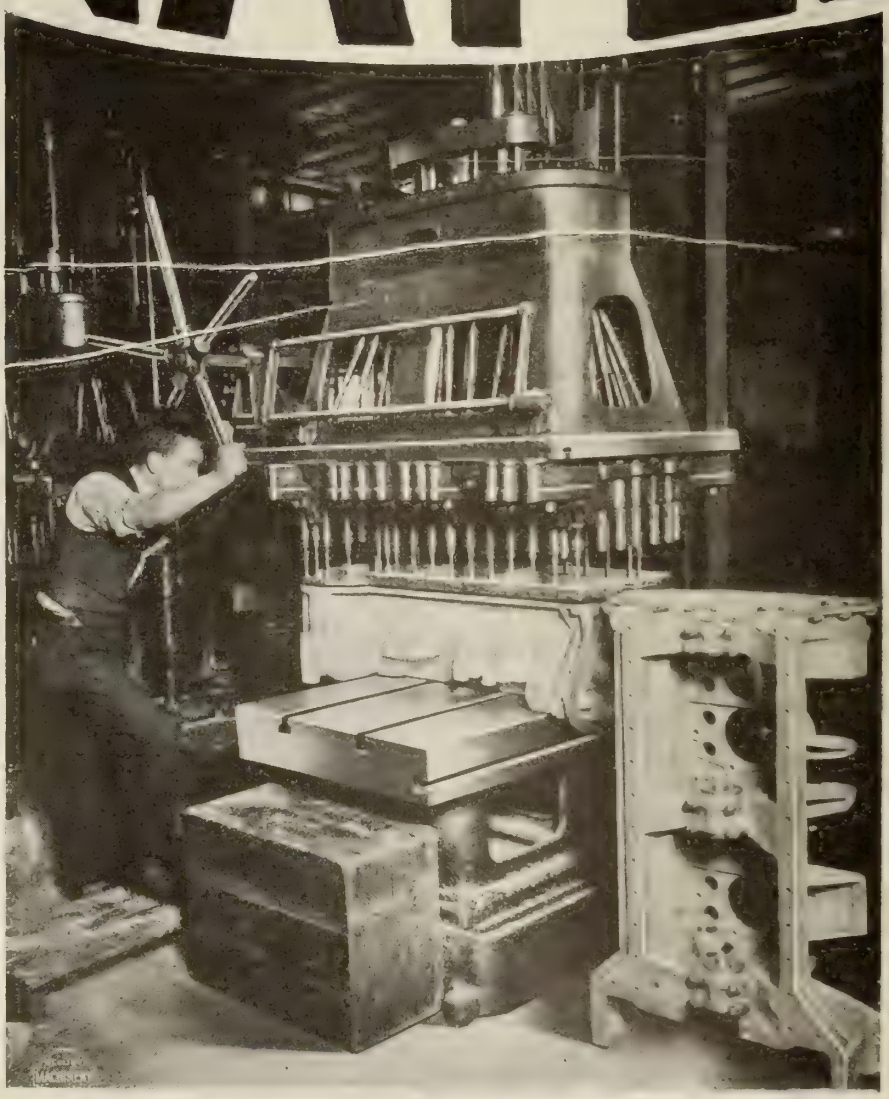
NATCO



DRILLING 38 HOLES OF DIFFERENT DIAMETERS IN ONE OPERATION

The above cut visualizes the great economical possibilities of NATCO Multi-Drillers.

This driller is one of many NATCOS installed in the plant of the Hinkley Motors Corp. It is drilling 38 holes of different diameters in one operation in the bottom of aluminum crank cases.

A patented feature of the NATCO, Independent Change of Speed to each individual spindle, permits drills of various sizes to be driven at approximately their correct cutting speed.

NATCOS are built in 11 sizes, ranging from 2 to 72 spindles.

We also design and build jigs and fixtures for use in connection with NATCO Multi-Drillers.

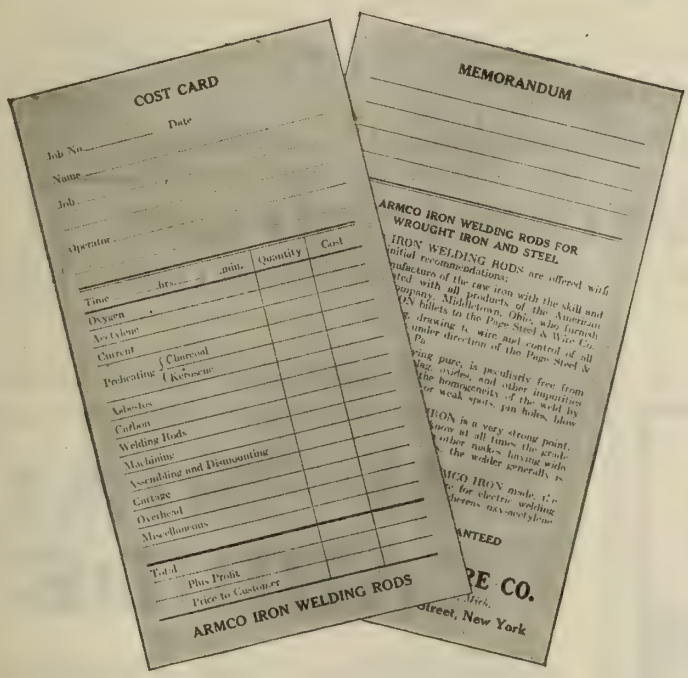
ARMCO WELDING RODS IRON



ARMCO IRON Welding Rods cost a trifle more than ordinary welding rods, but the difference is insignificant when other material and labor costs are considered. The superiority of an ARMCO weld, on the other hand, is of inestimable value to the welder who is building up a reputation for quality of work.

99.84 per cent. Pure Iron

The guaranteed purity of ARMCO IRON Welding Rods insures complete and uniform cohesion and maximum strength of welded section. ARMCO IRON Rods for either electric or oxy-acetylene welding will do all the work (and **better** work) that formerly was thought to require a wide range of welding compositions.

Uniform Composition

The uniform composition of ARMCO Rods, as proven by microscopic and chemical analysis, is another assurance of tough welds that will endure the most severe service. ARMCO Rods flow freely and make a weld that lends itself perfectly to finishing operations.

ARMO IRON Welding Rods are a strictly American product, unsurpassed by any real or so-called imported iron.

Send for a free supply of these practical Welding Cost Cards.

All welding shops should keep accurate cost records. Such records not only insure a profitable charge for every job, but also, if properly filed, are an excellent basis for quick and safe estimates on subsequent work.

The card illustrated above itemizes every important cost item and, if filled in where indicated, and preserved, is a very convenient and satisfactory record. Any quantity will be furnished on application, without charge.

The cost of welding rods, compared with the total cost of the weld, is such a small item that you can't afford to buy cheap material.

AMERICAN ARMCO INGOT IRON

The trade mark ARMCO carries the assurance that iron bearing that mark is manufactured by the American Rolling Mill Company with the skill, intelligence and fidelity associated with its products, and hence can be depended upon to possess in the highest degree the merits claimed for it.

Six Post Readers in New Cabinet

FORMER Finance Minister Cashen, who, following the crisis which led to the resignation of Premier Lloyd, of Newfoundland, has been called upon to form a Ministry, has already selected nine members to act with him.

Six of these, including the Premier himself, have been regular readers of THE FINANCIAL POST for some time.

This does not only indicate the quality as well as the extent of our circulation, but indicates also that men who carry big responsibilities find THE POST of value to them. It indicates, therefore, the approval which is meeting the effort of our editors and the great importance and value of the business information to which subscribers have access through the columns of THE FINANCIAL POST.

When the Government of Newfoundland was recently arranging the flotation of a $5,000,000 bond issue THE POST'S opinion as regards some methods of marketing was quoted by members of the Cabinet.

The Financial Post at Ottawa

IN the Dominion House of Commons the other week the attention of the Government was drawn to an article in THE FINANCIAL POST containing a reference to the financing of Roumanian orders through an agency established in London by Sir Clifford Sifton. Sir Thomas White mentioned that in reading his FINANCIAL POST that week, he had formed the opinion that the reference was to private marketing of bonds.

Keen Business Men and Cabinet Ministers Read the Post

SIR THOMAS WHITE, with other Cabinet Ministers and prominent Canadian men of affairs, have found THE FINANCIAL POST of swift and sure business service. When you "get down to business" you want the plain facts—all of them—without frills—and quickly. You get them like that in THE POST. THE FINANCIAL POST will keep you informed on Canadian business matters in a way unrivalled by any other publication. Send for a subscription to-day. The price is $3.00 per year, and you have only to fill in this form:

The MacLean Publishing Co.,
143-153 University Ave., Toronto.

Send me THE FINANCIAL POST every week till further ordered. I will pay subscription price, $3.00 per year, on receipt of bill, or you may draw on me for this.

Sixty-four operations with one set-up of the work —

LANDIS

The job referred to is a typical LANDIS achievement—a striking example of the saving of time and labor which is possible with the LANDIS Boring, Milling and Drilling Machines.

The job requires in all sixty-four distinct operations, including boring, milling, drilling and tapping. One set-up of the work—a heavy piece—is all that is required on the LANDIS.

Versatility is a strong feature of the LANDIS. Wherever installed, it is always busy. Ask us for full details on this profitable machine.

Why not learn the full details? Catalog on request.

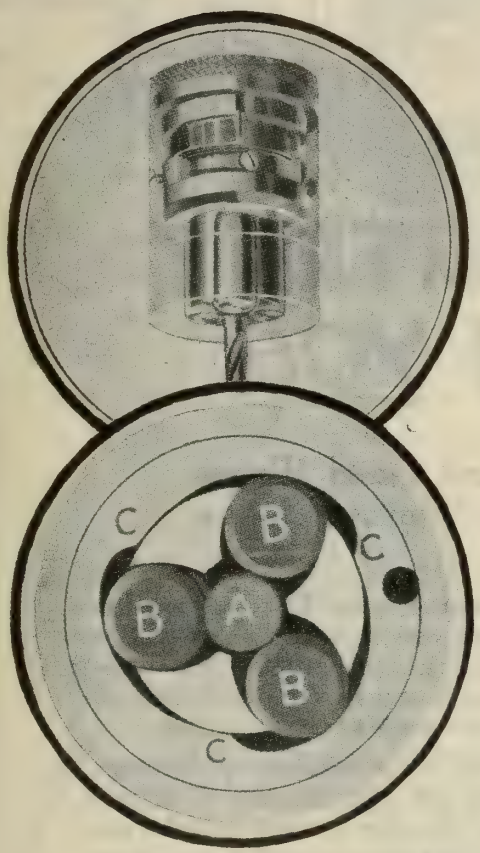
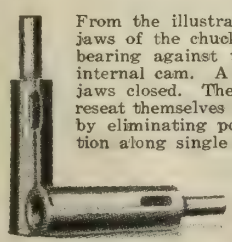
SKF AUTOMATIC-QUICK ACTING SELF CENTERING DRILL CHUCKS

Suggestion No. 1 →



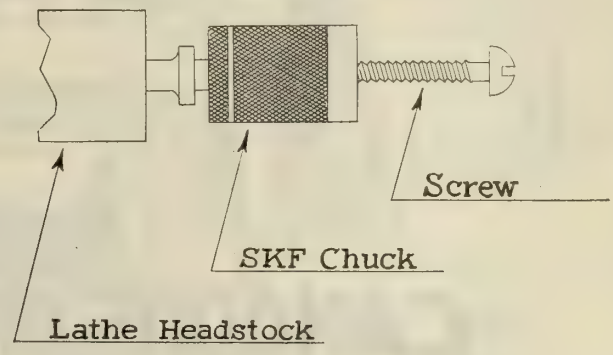
A—*Drill Shank*
B—*Roller Jaws*
C—*Cam Surfaces*



Increase Size Range by using Adapters

From the illustration it will be seen that the jaws of the chuck are formed by three rollers bearing against the surfaces of a three-lobed internal cam. A coiled spring holds the roller jaws closed. The rollers are free to turn and reseat themselves with every drill release, thereby eliminating possibility of wear or indentation along single line of contact. The drilling resistance forces these rollers up the cam surfaces, causing them to close upon and grip the drill shank with a power always proportionate to the drilling stress, thereby precluding slipping of the drill under any conditions whatsoever.

For Removing Burrs From Screw Heads After Slotting



No danger of breaking screw threads with the SKF Chuck

IT'S just another application of the SKF Chuck. The chuck is mounted on a lathe spindle. Machine screws are inserted in the drill opening, burrs in the screw heads are polished off and screws removed in rapid succession. The threads are not damaged because the smooth roller jaws grip the screws just enough to hold them firm.

There's a special application of this chuck that is just suited to your needs. Our engineering department will find it. Write to-day.

CANADA'S PROSPERITY RESTS WITH *YOU*

Continued Business Activity and Good Wages Depend on Canada's New Victory Loan

DURING the past four years Canada's prosperity has been due largely to orders from Great Britain and our Allies.

Canada was able to obtain these orders because she advanced credit to these countries.

Canada was able to give this credit only because you bought Victory Bonds.

Great Britain, with France, Belgium, and other Allies, are now prepared to place large orders with us for the products of our factories, farms, forests and fisheries—provided Canada again gives them credit.

Credit must be given if we are to have any guarantee of good times and good wages. But our workers on these orders must be paid their wages in cash; so, much of the money that you invest in Victory Bonds will go out in wages to Canadians.

You will be absolutely protected—you will get a good rate of interest and all of your money will be paid back at the time stated in the Bond.

Every cent will be spent in Canada, and ultimately circulate to the benefit of all.

Canada can give this credit only if you again buy Victory Bonds.

If Canada is not able to give this credit, other countries will.

Therefore Canada's continued prosperity rests with you.

Victory Loan 1919

"Every Dollar Spent in Canada"

Issued by Canada's Victory Loan Committee, in co-operation with the Minister of Finance of the Dominion of Canada.

The City of St. Catharines

The Mecca of INDUSTRY

TRANSPORTATION—Situated on C.N.R., G.T.R., and Welland Canal. Dominion Express and Canadian Express operation. Steamer line to Toronto. Electric railway line to Niagara Falls, Welland, Port Colborne, Niagara-on-the-Lake, Port Dalhousie, Merritton and Thorold.

GENERAL—Population, 19,500. City has up-to-date street railway, electric, gas, water, and sewage system. Centre of Niagara fruit belt. Industrially the district now includes principally metal industries and pulp and paper mills, several silk, woollen and haircloth factories, auto tire and rubber and footwear industries and numerous industries connected with the fruit products of the district.

SPECIAL INDUCEMENTS—The city is prepared to co-operate with new concerns and offer attractive inducements to all worth-while industrial projects.

Come and see the city of rare opportunities or investigate by writing the secretary of the Board of Trade for full information.

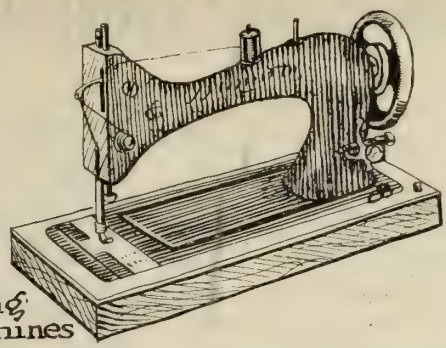
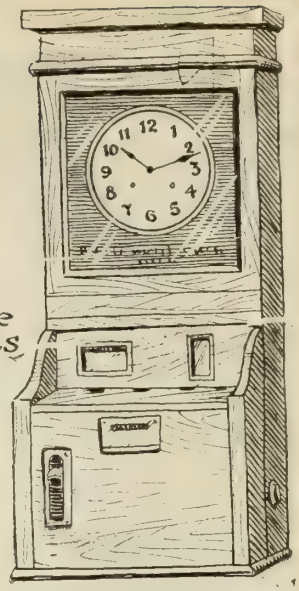
Small Tools



Sewing Machines



Time Clocks

It's Made for YOUR Work

Leading manufacturers of scores of different kinds of light machines are of the opinion that the Bilton Gear Miller was designed for their individual needs.

It so speedily and acurately produces spur and bevel gears and worms, and the countless small irregular parts that enter in the makeup of your product, that you cannot be blamed for thinking it was built for your special use.

It is a valuable addition to your tool room for producing small milling cutters, reamers, etc.

If production increase interests you, our circulars will make pleasant reading: better put in that request to-day.

CLEVELAND HOSE SPECIALTIES

Bowes Automatic Air Hose Couplings

Standard Equipment Everywhere

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.
STYLE I.F. is an inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.
STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE O.M. is an Inside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.
STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ¼-in. to 1½-in.
The Male and Female Ends of Bowes Couplings interchange in sizes ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-in.

The Cleco Never Slip Hose Clamp

Made in same sizes as Bowes Couplings

The adjoining cut of Cleco Never Slip Hose Clamp shows the "Flanges" which engage the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings and valve to use and proper way to attach the clamps.

CLECO GROOVED HOSE NIPPLE

Grooved Nipples when attached to hose with the wire clamp cannot "blow-out," as one-half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently.

WIRE CLAMP TOOL

To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery. In Stock: Riveting and Chipping Hammers, Four-piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, etc.

Use Annealed Wire No. 14

Write for Bulletin 38 illustrating Cleco Hose Fittings, Couplings, Valves, etc.

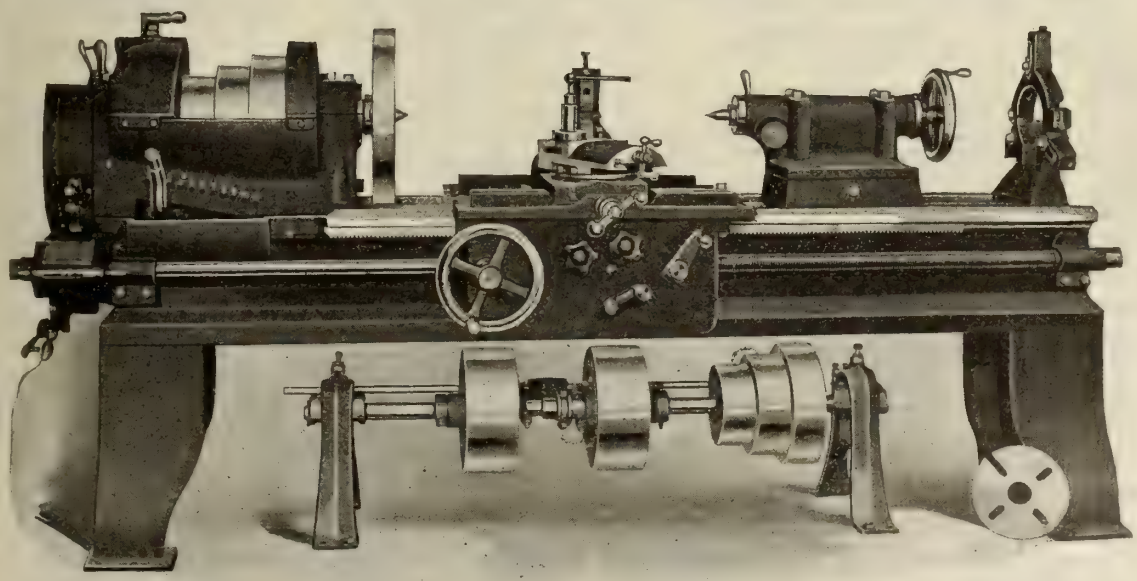
IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.

Write for Bulletin 34A, 41 and 43.

CLEVELAND PNEUMATIC TOOL CO. OF CANADA LTD., 84 Chestnut St., TORONTO

A. R. WILLIAMS MACHINERY CO., TORONTO, 337 Craig St., W., MONTREAL. WILLIAMS & WILSON, MONTREAL

The "RAE" 18-inch Quick Change Double Back Geared Lathe



Users of this lathe will find it one of the most accurate and strongest on the market.

An investment in a "Rae" will pay you big dividends in quality of work and long, efficient service.

May we send full specifications?

Ask your dealer. If he cannot supply you, write us.

SYSTEMS

Autoforce Ventilator

Steam Turbine

AIR SPECIALISTS!

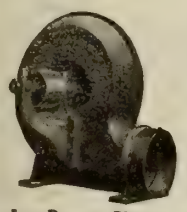
The name Sturtevant symbolizes the best engineering practice in design and construction of air-moving and power apparatus, and is the outcome of over 60 years of "knowing how."

Electric Propeller Fan

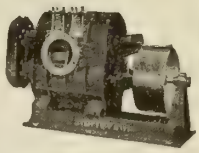
Medium Pressure Blower

Supremacy

Quality, efficiency and reliability have combined to mould the ideal upon which the largest staff of fan engineering experts in the country have developed the "built in" supremacy of Sturtevant products comprising **Fans, Blowers, Exhausters, Heaters, Ventilators, Air Washers, Fuel Economizers, Vacuum Cleaners, Steam Engines, Steam Turbines, Electric Motors, Generating Sets.**



Low Pressure Blower



High Pressure Blower

Engineering Service

To assist prospective purchasers 21 Sturtevant engineering service stations are maintained in the leading business centres of the country. A staff of Sturtevant engineers is ready to serve you promptly. Their service is worth money—and is free. Get better acquainted with the Sturtevant line.

Announcing—

WILLIAMS' "Vulcan" Forged-Cutter Tool Holders give unequalled service to those who prefer the solid, forged-type of cutting tool. Each Holder, by the mere insertion of small High Speed Forged-Cutters is adapted to the heaviest service on Lathe, Planer, etc.

The economy and convenience of this line, when installed as standard shop equipment, is at once apparent, as all blacksmith work, to say nothing of the very considerable investment necessitated by heavy, solid forged-tools of costly High Speed Steel, is eliminated.

Absolutely simple in construction, yet possessing all the advantages of the solid tool without its expense.

Cutters, drop-forged from the finest grade of High Speed Steel, in stock in a great variety of sizes and types, finished and hardened ready for use. Ask for descriptive booklet.

J. H. Williams & Co., 45 Richards Street, Brooklyn, N.Y.
The A. G. Low Co., Ltd., 45 Pacific Ave., Saskatoon, Sask.
Agents for Manitoba, Saskatchewan, Alberta and British Columbia

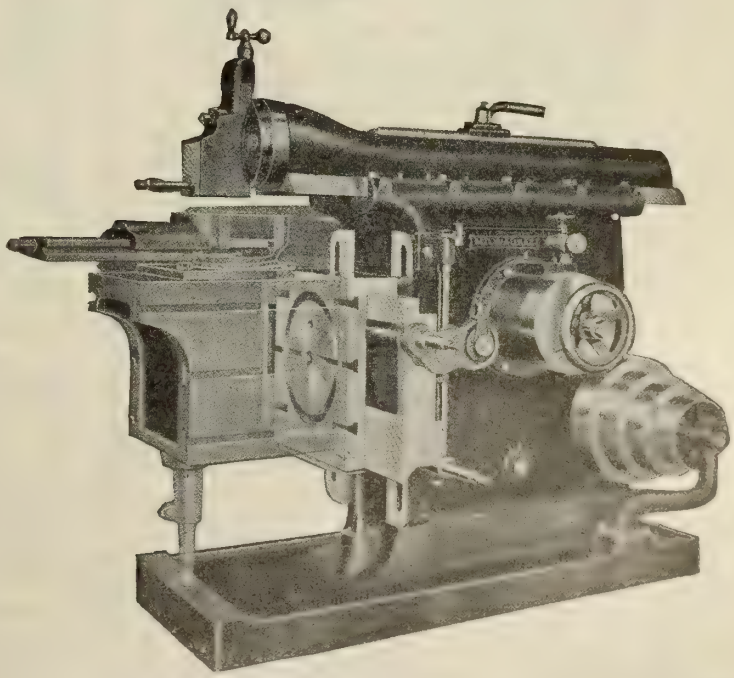
Williams' "Vulcan" Forged-Cutter Tool Holders

Milwaukee Shapers

Are needed in Up-to-date Canadian Shops

Milwaukee simplicity, power and accuracy play an important part in turning overhead expense into profitable production.

Milwaukee Back Geared Crank Shapers are built in 16-inch, 20-inch and 24-inch sizes.



MILWAUKEE SHAPER CO.

1029 Coldspring Ave.

Milwaukee, Wisconsin

WHEN THINKING OF BELTING KEEP IN MIND THAT

The back of the Ox

is the part where the fibre of the hide is tightest and unaffected by the action of breathing, therefore the most suitable to produce a dead straight and practically stretchless belt.

Tullis
LEATHER BELTING
COLUMBIA BRAND

is made entirely from this portion of the hide.

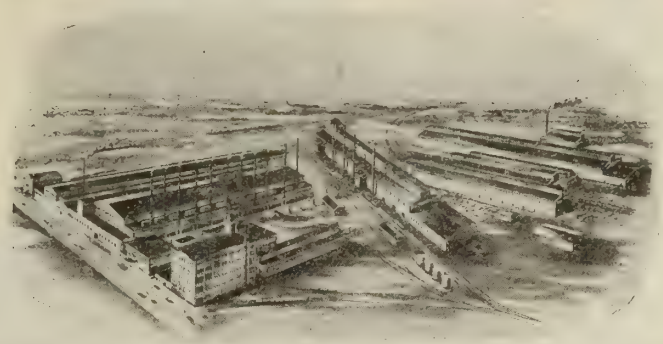
A Plant Equipped in Every Detail to Suit Your Every Need



STEEL PRODUCTS

Open Hearth, Basic and Acid, Electric and Alloy Steels.

CASTINGS

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons.

RAILWAY SPECIALTIES

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears.

FORGINGS AND BILLETS

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings.

PLATES

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon, Automobile Plates and Sheets.

AGRICULTURAL STEEL

Soft Centre and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades.

DOMINION FOUNDRIES AND STEEL, LIMITED
HAMILTON, CANADA

60 Rivets in a Minute

Faster if the work can be fed faster.
But at least 60 every minute.
And in tightest corners just as fast. Every head just as smooth. Not a bent shank; not a tool mark on either rivet head or casting.

GRANT

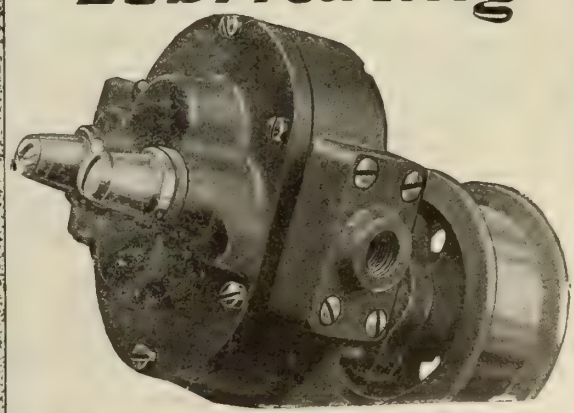
Rivet Spinning Machines

handle any rivet up to ¼-in. shank.
If Grant-made, every hard steel rivet is finished as smooth and as true as every rivet of soft brass.
The Grant Book called "Perfect Riveting" tells how to give an extra appearance of quality to your product. For your copy

Write to-day

GRANT MFG. & MACHINE COMPANY
Holland Avenue, Bridgeport, Conn.

TRAHERN PUMPS
Lubricating



For efficient service and long life. They are built to stand the gaff—hard, continuous use, free from trouble. While running at 500 R.P.M. they will deliver 16½ gals. of coolant per minute or just a drop at will of the operator.
Free even flow—no pulsation. Operate in either direction and against pressure.

Write to-day for Cat. 44 and prices.

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

KEARNEY & TRECKER CO.

MILWAUKEE, WIS. U.S.A.

SERVICE

and "THE COVENTRY" Chains are synonymous terms. This is attained by correct design, the use of special analysis steel, first-class workmanship and a rigid system of examination.

These, combined with a determination to produce only the best, give that steady, continuous service which is an essential feature of "THE COVENTRY" Chains.

The same service is at your disposal. If you wish to instal the most efficient form of Power Transmission, our Technical Staff will gladly give you all the assistance needed, without obligation, and without prejudice to any particular form of drive.

Reaches Anywhere

General Purpose Oiler

bottom, in three sizes—No. 1, 1-3 pint, No. 2, Made with steel spring ½ pint and No. 3 1 pint. A 7″ spout to each.

Combination Filler and Funnel

For Hardware Stores, Garages, etc., in four sizes — No. 101, 1 pint and 10″ spout; No. 102, 1 quart and 13″ spout; No. 103, ½ gal. and 13″ spout; No. 104, 1 gal. and 13″ spout.

R. R. Oiler

For Locomotive, Machinery, Threshers, etc. In two sizes—No. 4, 1 pint and 10″ spout; No. 5, 1 quart and 11″ spout.

Oil Gun (No. 201)

For Automobile and all types of machinery. Fitted with a 9-inch spout.

Why the All-Way Oiler Sells

The All-Way Oiler reaches anywhere by means of a flexible spout that may be bent to suit any place that must be reached. In using the ordinary oiler much oil is lost in attempting to reach awkwardly situated oil holes. The saving of oil from this feature reduces oil bills 50%. All-Way Oilers have a special cleaning device at the end of the spout which insures their being always ready for use.

Pratt & Whitney Taps

"With the 'Con-eccentric' Land"

P & W Taps are **good** taps —easily the best where accuracy and high speed are essential. They cost more to buy, but less to use than others.

If you're doing work that calls for big production and for unusual precision give them a trial. You'll be back for more when you see them prove themselves.

The "con-eccentric" land — the special feature of Pratt & Whitney Taps permits sharpening on face of the cutting edge without affecting size. It lengthens life and assures accuracy hitherto thought impossible in a commercial tool.

Where You Can Buy Them—

New York, 326 Hudson St. **Boston**, 93-95 Oliver St. **Philadelphia**, 405 N. 21st St. **Cleveland**, 730 Superior Ave. **Detroit**, Kerr Machy. Bldg. **Chicago**, 571 W. Washington Blvd. **St. Louis**, 516 N. 3rd St. **Cincinnati**, 336 W. Fourth St. **Birmingham, Ala.**, 2015 First Ave. **St. Paul, Minn.**, Robinson, Cary & Sands Co. **New Orleans**, C. T. Patterson Co., Ltd. **San Francisco**, 16 to 18 Fremont St. **In Canada**— Pratt & Whitney Co. of Canada, Ltd., **Dundas, Montreal, Toronto, Winnipeg, Vancouver.**

Canadian Machinery and Manufacturing News, October 16th, 1919. Vol. 22. No. 16. Published weekly at 143-153 University Ave., Toronto, Canada. Subscription price in Canada, $3; United States, $3.50. Entered as second-class matter at the Post Office Department, Ottawa, Canada. Entered as second-class matter July 1, 1912, at the Post Office at Buffalo, under the Act of March 3rd, 1879.

Five Minutes To Eleven has not yet come for those who stayed at home

The gallant Canadian army kept right on fighting until five minutes before the Armistice was signed.

The last lap of the war for those men was indeed a smashing, glorious finish!

While the fighting ended at five minutes to eleven on the morning of the eleventh of November last year, the war has not yet ended for those of us who stayed at home.

Our "Five Minutes to Eleven" has not yet come. There is a great deal more for us to do, before our war job is finished.

There are still heavy demobilization expenses to clean up. In a few short months we have brought home the troops that were transported overseas during four years of war—four years' transportation expenses crowded into a few months.

Many millions are still required to complete payment of demobilization and for other purely military expenditures.

The Victory Loan, 1919, which is necessary to meet these war obligations is the great objective in the last lap for those who stayed at home.

The Canadian Corps, during the war, never lost a gun,—never once retreated and never failed to take an objective.

Keeping that glorious record in our minds, and carrying that "no surrender" fighting spirit into the new Victory Loan campaign, there can be only one result:—Success, overwhelming and triumphant.

When the figures for the Victory Loan, 1919, are totalled up, the result will show the world that those of us who stayed at home have taken another glorious objective on the road to our "Five Minutes to Eleven."

Victory Loan 1919

Issued by Canada's Victory Loan Committee
in co-operation with the Minister of Finance
of the Dominion of Canada

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15″, all standard sections of ANGLES from 6″ x 6″ down to 1¼″ x 1¼″, ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14″ wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process, and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6″—5 x 5″—4 x 4″
3½ x 3½″—3 x 3″
2½ x 2½″—2¼ x 2¼″
2 x 2″—1¾ x 1¾″
1½ x 1½″—1¼ x 1¼″

ANGLES—Unequal Leg—
6 x 4″—6 x 3½″—5 x 4″
5 x 3½″—5 x 3″—4½ x 3″
4 x 3½″—4 x 3″—3½ x 3″
3½ x 2½″—3 x 2½″—3 x 2″
2½ x 2″

BEAMS—
15″, 12″, 10″, 8″, 6″, 5″, 4″, 3″.

CHANNELS—
15″, 13″, 12″, 10″, 8″, 6″, 5″, 4″, 3″.

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜″
3⅜ x 5⅛ x 3⅜ x 7/16″
3 1/16 x 4 x 3 1/16 x ¼″
3⅛ x 4 1/16 x 3⅛ x 5/16″
3 3/16 x 4⅛ x 3 3/16 x ⅜″
2 11/16 x 3 x 2 11/16 x ¼″
2¾ x 3 1/16 x 2¾ x 5/16″

ROUNDS—
All sizes from ½″ up to and including 4″.

SQUARES—
All sizes from ½″ up to and including 3″.

FLATS—
All sizes from 1 x ¼″ up to and including 14″ wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

Cast Nichrome Annealing Box

Cast "Nichrome" Heat Treating Containers

Carbonizing and annealing boxes and other heat treating containers must be durable to withstand the action of heat during operation.

Cast iron, cast steel, structural steel and wrought iron receptacles **crack, grow, scale** or **warp,** their use is inefficient, involving costly maintenance due to additional expenses for labor, fuel, material and constant replacement.

Cast Nichrome boxes, pots, tube and retorts guarantee uniform high quality of product, increase the capacity of the plant, and reduce the cost of heat treatment.

Write for further particulars.

OUR AIR COMPRESSORS ARE ACCESSIBLE

One of the most important points about an air compressor is that it should be so built that inspection and cleaning can be done with the least amount of trouble. The horizontal type of construction which we have adopted is particularly handy—cylinder valves, etc., are readily accessible; crossheads and guides can be inspected and cleaned without unscrewing bolts and removing plates; and the crank, etc. are available for inspection simply by lifting off a cover.

Write for our compressor bulletins for further information.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

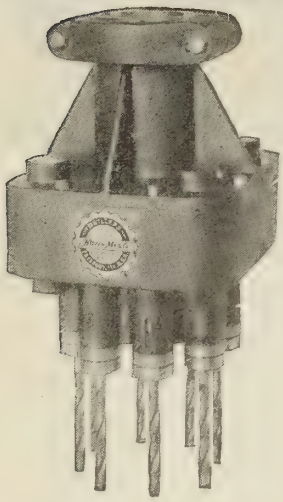
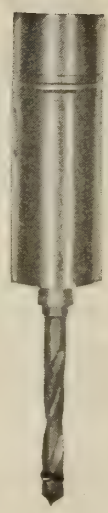
2 Minutes or 20?



This Is The Vital Question



Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

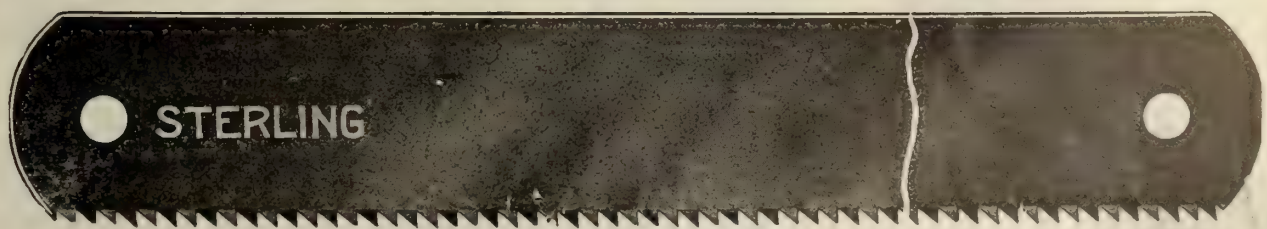
Simonds Canada Saw Co. Limited
ST. JOHN MONTREAL VANCOUVER

HACK "STERLING" SAWS



MANUFACTURED BY
DIAMOND SAW & STAMPING WORKS -:- BUFFALO, N.Y., U.S.A.

To cut down the cost per cut

250% More Work

In power hack sawing, compound acts more as a coolant than as a lubricant. Cutting heats the blade, and the purpose of the compound is to prevent the temper of the blade being drawn.

A few drops of oil or a scanty flow of compound simply tends to hold the chips in the cut and is frequently responsible for broken blades. Whatever you are using for a coolant, compound, or water, see to it that the work is flooded except when cutting iron castings. If you use compound, keep it thin and well agitated. Actual tests have proven that the use of compound will increase the amount of work accomplished by 250 per cent.

Get a copy of the Starrett Hack Saw Chart "3" pick the right blade, put on the weight, see to it your S. P. M. are right—and watch your cutting cost decrease.

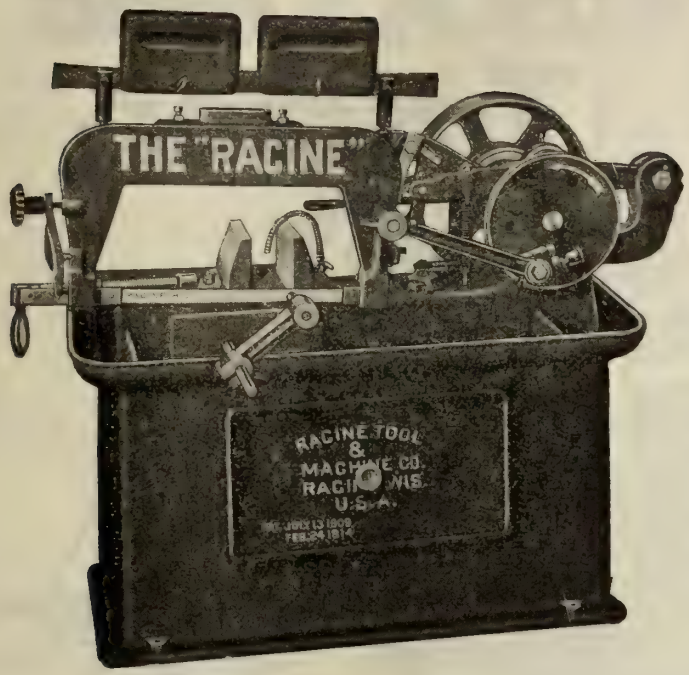
Standard the World Over

"THE RACINE"



HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

Use "Racine" H.S. Tungsten Power Blades

BRISTOOL

Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.

It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.

And it is built to last.

It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.

Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.

Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

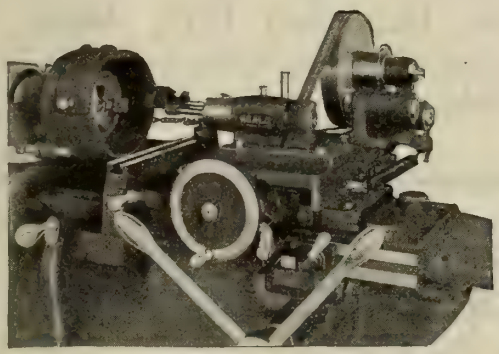
CAPACITY:

Grinds ¼″ to 2″ dia. x 4″ long.
Collet capacity ⅜″ to 3″ dia.
Swing 6″ dia. with water guard.
Swing 10″ dia. without water guard.
Diameter of workhead bearings 1⅝″ to 1⅜″ dia.
Net weight complete, 1,100 lbs.
Floor space 26″ x 50″.

FEATURES:

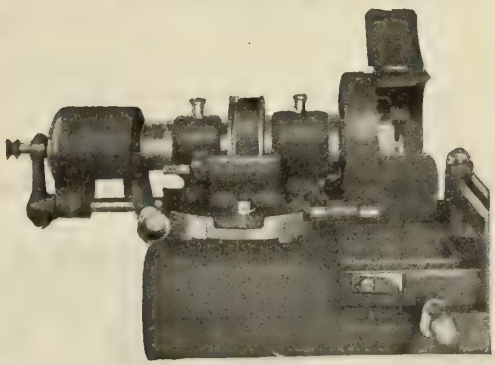
Automatic Brake for work.
Also stops flow of water.
Device for preventing distortion of work when chucking.
New Type 10 wheelhead.
Flexible idler — automatic wheel guard.
Positive stop for table.

FOR GRINDING SMALL SHORT WORK



New design type 10 wheel-head with flexible idler. This combination has proved unusually successful in giving finish and production.

NEW HEALD No. 85 INTERNAL GRINDER



Rigid workhead with massive bearings bolted directly to the base.

Lever which operates quick-acting collet.

A new, simple productive machine for small, short work. While it is simple to an extreme, the following features put it in a class by itself.

It is arranged so that movement of the pilot wheel to the right not only draws the wheel from the work, but automatically applies a brake, stopping the workhead and shutting off water supply.

The quick acting collet operated by a lever and which has a special adjustable compensating device against distortion of any thin work which is being held.

The table is provided with a positive stop accurately covering the travel, enabling the operator to grind up to a shoulder or any given point without danger of over-running. Lever for cross-feed of head is situated so it can be operated with the left hand while the right can still grasp the pilot wheel.

The machine is also equipped with flexible idler — automatic wheel guard — water attachments—and simple, single countershaft.

Notes On Grinding
NORTON COMPANY WORCESTER, MASS.

No. 68A

A Few Facts for the Forge Shop

Because grinding wheels and machinery are used only occasionally and on a small scale in the average forge shop is no reason why fundamentals for correct usage should be completely ignored.

We advocate that some attention be paid the following details, not for any selfish reasons, but because it means dollars and cents in saving to the user:

1.—MACHINE CONDITIONS

Whether the machines be of the bench or floor type, they should be of heavy construction and anchored rigidly to the bench or floor. This is to prevent vibration—a source of wheel waste.

Keep the bearings properly taken up so that no undue vibration comes from loose boxes.

Remember, vibration means waste of abrasive.

2.—WHEEL SPEED

The correct speed for wheels used in the forge shop is between 5,000 and 6,000 surface feet per minute. If possible, the R.P.M. of the grinding machine spindle should be increased as the wheel wears down, so that this speed is maintained as nearly as possible.

Slow speeds make wheels act softer and hence wear faster.

Slow speeds cause wheels to get out of truth quickly—hence, out of balance. Often the wheel is accused of having hard and soft spots, when in reality it is not kept in truth.

3.—CORRECT GRAIN AND GRADE

Good wheels for the forge shop are 36-O or 30-P ALUNDUM for off-hand grinding of chisels and tools. For grinding forgings 24-Q ALUNDUM will usually give satisfactory results. For the flashes left in drop forging or for sharper contact, use 24-R ALUNDUM.

These are but general recommendations and it is usually better to specify for each particular class of work and set of conditions after they are known.

We make ALUNDUM wheels to suit every job in the forge shop.

No inquiry is too small to receive the most careful attention of trained engineers. This branch of NORTON service is free to the inquirer who has a difficult grinding problem and cannot solve it.

Vol. XXI. No. 15 October 16, 1919

A Discussion of the Various Types of Jigs

To Obtain Intensive Production, Together With Interchangeable Parts, Jigs Become a Necessity. There is Generally a Fundamental Principle Involved, Which is Varied to Suit Requirements. These Are Discussed Herein

By ROBERT MAWSON

IN these days of manufacturing, jigs are becoming more necessary every day, so that intensive production and interchangeable parts may be obtained. Almost any plant, no matter how large or small may be its output, can and should use jigs as a manufacturing medium.

The problems confronted by different shops or tool designers may be varied, yet there are certain principles, which may be called fundamental, that are applicable to all cases.

With this in mind, I have endeavored to analyze some leading features of the subject and illustrate them by actual shop practice.

The tools herein described are being used successfully and will help any shop in solving some of the problems which daily occur in their tooling operations. In passing, I might add a definition to two terms often used by the tool designer, namely, jig and fixture.

What is a jig, and what is a fixture?

A jig is a special contrivance to hold a part being machined (usually under a drilling machine, though not necessarily) the tool not being held in the machine tool.

A fixture, on the other hand, is a special device to hold a part being machined and is fastened or fixed to the machine during the machining operation.

There are, however, some cases where a jig is very large, and is also fastened on the machine table. Under such cases I personally would call such a tool a jig fixture. In this article I am taking up a brief study of jigs only.

In jig design, first the tool should be made as simple as possible. Second, it should be made light in weight and yet sufficiently strong. Third, the part being machined should be held rigidly. Fourth, chip clearance should be provided, or, better still, means for them to drop away entirely. Fifth, the tool should be made so that the part being machined may be placed into and removed from the jig easily, quickly and conveniently.

These fundamental principles should be applied to all jigs. Other features will be noted as we discuss the certain types of jigs.

Simple Plate Jig

Fig. 1 shows one of the simplest types of jigs used, known as a plate jig.

This tool is good for drilling parts which have had a hole machined in them, such as a pulley fly wheel, disc, etc.

The part is located on a pin A, which fits into the machined hole and the piece held against the surface of the jig by means of clamps.

Legs or feet B should be provided on the jig so that no surface of the piece being machined touches the drilling machine table during the operation.

The body of the jig may be either made of a cast iron or soft machine steel plate. With such construction hardened steel bushings accurately ground to size are placed in the jig plate to guide the drills or reamers. Sometimes the jig is made with the body of tool steel hardened and the holes lapped to size. The trouble with this construction is that first, there is danger of the plate changing its shape during hardening, so that the various holes are not in their desired positions. Second, should the holes wear by repeated use, the repairing of same is difficult, necessitating annealing of the jig plate and the insertion of bushings for the worn holes.

The decision whether to make the tool as shown, or as noted by the second method, depends largely on the contemplated number of parts which will be machined in the jig.

It is sometimes desired to machine a hole or holes in a plane at right angles to the bored hole. The illustration (Fig. 2) shows a jig designed for such an operation.

This tool may be called a simple angular jig.

The Casting

In this case a sprocket wheel is again located by a pin A. The pin is made with a turned shoulder, and after the part to be machined has been placed on to the pin, the horse shoe or open washer B is placed on the pin as shown.

The pin is then drawn back by means of a thumb nut at the rear of the jig, the washer is forced against the piece, thus holding it in position.

The hole to be drilled must be on a certain relation with the teeth, and to obtain this result one of the teeth is brought against the stop plate C.

The drill is guided through a bushing in the usual manner.

Simple Ring Jig

When a casting or piece requires a number of holes to be machined in a radial direction it may be performed by means of an indexing jig or a simple ring jig—the latter type of tool is shown in Fig. 3.

The casting is placed in the jig and slid around until a lug on the piece comes against a stop pin.

The two clamps A are then tightened against the casting to hold it securely in the jig.

The tool is afterwards placed on a right angle knee provided with a pin which fits into the hole B. The operator can then revolve the jig around on the pin so that the various bushings come in line with the drill or reamer, so that the holes will be machined in a vertical direction.

The question of when to use an index type of jig or when to design the simple ring type as illustrated is again a matter of quantity of parts to be machined.

The index jig is much more expensive to design and make, but usually produces parts quicker and more accurately. On the other hand, the simpler type shown will give satisfactory results after the operator has become accustomed to it.

It will usually be found an advantage to design jigs of as open a construction as possible. The advantages are low cost, ease to place the part into the tool,

chips readily fall away from the machined holes.

A simple type of open double right angle jig is shown for the next example at Fig. 4. The casting is located by a large circular plug A, which fits into a previously bored hole.

The piece is then swung around on the plug until it registers against the stop pin B. The open clamp C is next slid under the bolt as shown and the hook bolts D turned with their heads resting on the flange of the casting.

A feature of the clamp may be mentioned, namely, the providing of two hardened pins E, which come in contact with the casting. This construction ensures the strap setting properly on to the piece should it be (which is almost always the case) uneven on its surface.

The jig is then turned over to the position shown in Fig. 5 and the thumb nuts A and B tightened. This action draws down the hook bolts and strap against the casting, thus holding it firmly in the jig. The holes may then be machined in the usual manner.

The practice of using thumb nuts is a great advantage as the part may be placed into or removed from the jig much quicker than if the operator had to resort to the use of a wrench to tighten ordinary nuts on the bolts.

Left and Right Hand Jig

The designer sometimes has the problem of designing tools for both right and left hand elements. If the production be abnormally high the best practice would be to make a separate tool for each hand. With limited output one tool should be made to take care of both parts.

The illustration (Fig. 6) shows a tool designed to take care of both left and right hand pieces. The casting is placed on a pin A, which fits into a previously machined hole. The piece is then swung back against the stop pin B. The clamp C is next tightened against the casting by means of the thumbscrew D, thus holding it securely in position. The boss E rests on a height block so that the piece will set level in the jig during the drilling operations.

When machining the opposite hand, the clamp C is removed by taking out the thumbscrew and located in the slot F, the screw fitting in the tapped hole, which may be seen in the slot.

The casting is then located by means of the pin G and held in a manner similar to that described. The jig is reversed for the drilling operation, rest-

ing with the four legs or feet on the machine table. Care should be taken in the design of tools of this type to make the legs sufficiently long so that no part of the piece being machined or clamping devices resting on the table as with such interference accurate holes cannot be obtained.

Two-Angle Jig

It is sometimes necessary to drill holes in a piece at different angles. The tool must then be designed so that the bases on which the jig rests on the machine table bring the guide bushings in perfect alignment with the drill or reamer.

The illustration (Fig. 7) shows a jig designed for machining holes, two of these being at different angles with each other.

The casting A is dropped into the jig and pushed against the locating pins shown at the rear by means of the knurled head screw B.

The block C is then pushed under the piece which forces it against the locating pins, the block also acting as a support for the casting. The knurled head screw is then tightened, this action holding the piece securely in the jig.

A hole is then drilled at D, the jig resting on the base E and another hole at E after the jig has been rocked over with the face G resting on the machine table. The two bases being at similar angles to the guide bushings the holes are drilled at the correct angles.

Sometimes holes are to be machined very close together so that there is not room enough for the walls of the bushings. To overcome this difficulty, tool steel plates may be used, made as shown at H, with the guide holes for the drill machined in them. The drill is then accurately guided for the machining operation. It is obvious that when drilling these last four holes the jig will set with its rear wall on the machine table.

The view (Fig. 8) shows another angular jig but of a box type. The casting is slid in from the end and located by resting on two machined ledges, one on each vertical wall. The pin-headed screws A are then tightened on to the casting, which forces it down on to the locating surfaces and also against the pin B. The setscrew C is then tightened to force the casting against the rear wall of the jig.

In passing, it might be said that it would have improved the efficiency of this jig if the screw C had been made of the pin-headed type or other style which does not require the use of a wrench. The poles are then drilled, one in the position shown and others with the jig resting on the rear wall.

It will be noticed that the bushing D is made very long, reaching almost to the casting at the rear. This is done so that the desired alignment may be obtained which would be almost impossible if a short bushing was used and a long distance away from the part being drilled.

A construction detail here used might be mentioned, namely, that the forward wall of the jig is made of a separate element. This was done so that the somewhat difficult operation of machining the locating ledge on the rear wall could be performed more easily.

Open Angular Jig

The illustration (Fig. 9) shows an open angular jig with an interesting method of locating the piece. The block A is first drawn back by means of screw-

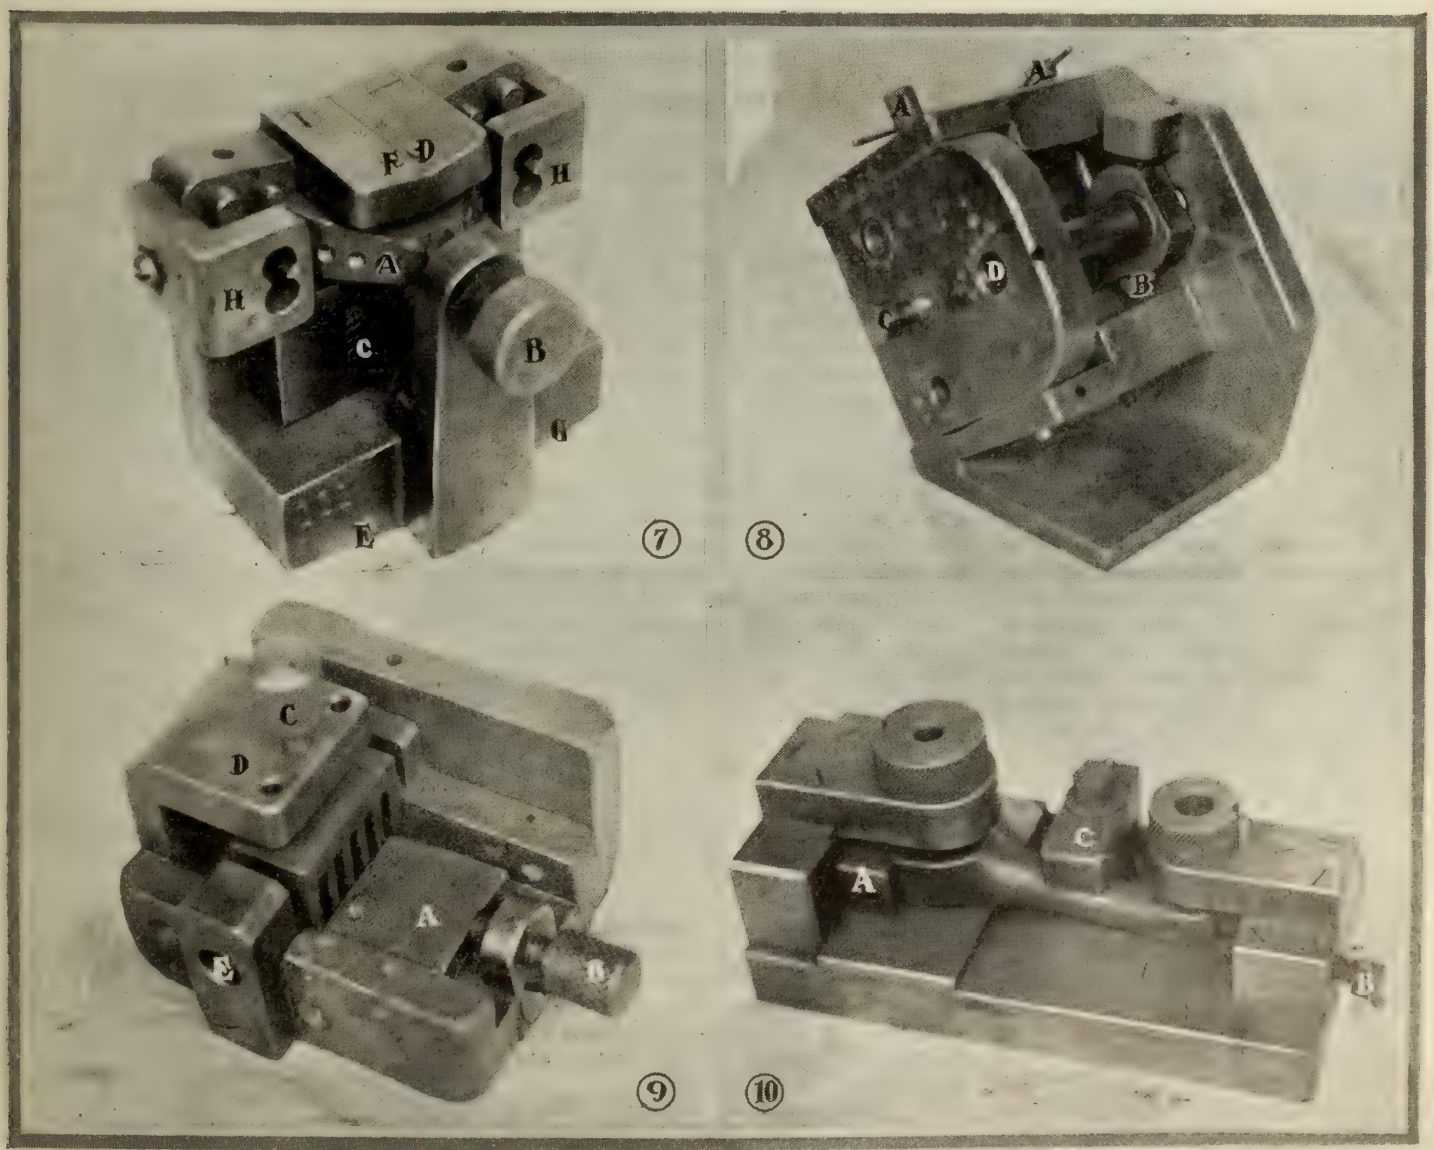

FIG. 7—TWO ANGLE JIG.
FIG. 9—OPEN RIGHT ANGLE JIG.

FIG. 8—BOX MULTIPLE TYPE OF JIG.
FG. 10—VEE LOCATION TYPE OF JIG.

ing the element B in a counter clockwise direction (which draws it back).

The piece is then placed in from the top of the jig and forced against a locating pin by screwing forward the block A. The knurled headscrew C is then tightened on to the piece to hold it down in the jig. The method of locating by means of the block is interesting, as it not only squares up the piece but holds it securely during the machining operation.

The knurled headscrews also tend to a quick operating tool. The two holes are drilled in the position shown, and a much larger hole with the jig resting on the rear face, the guide being through the hardened steel block E.

The jig shown in Fig. 10 is interesting in so far as it is of a built-up type. It is made of several steel blocks which are fastened together by means of screws and dowels. This method has some advantages as may be seen by studying the design. At the left side a steel block is fastened to the base of the jig, the block being of sufficient height to allow the casting being drilled to pass under the block.

In front of this block is another made in a V shape, and under this is a thin strip of hardened steel of sufficient thickness to permit the casting resting in a horizontal position in the jig. The first block also holds a guide bushing support, and this element is not only screwed and dowelled in place but also sets into a recess to insure its correct alignment.

At the right end of the jig is another height block, and fastened to it may be seen another bushing guide plate. The casting is slid in from the front and located by means of the V-block A.

The pin-headed setscrew B, which is placed at a slight angle, is then screwed in and forces the piece into the V-block and also against a stop pin at the rear right-hand end. The strap C is then tightened on to the casting by means of the setscrew shown. Changing of this hex-headed setscrew to a thumbscrew would seem to be an advantage, providing a quicker operating jig. Holes are then drilled in the casting, the tools being guided through the bushings shown. The advantage of a V-block for locating parts of this nature, having a circular contour as levers and the like, is that the machined hole will be central with the boss after the receiving angle has been correctly made and providing the castings or forgings do not change in size.

Another advantage is that the workman cannot change the setting which is sometimes done when adjustable locating points are provided.

A further discussion on this subject will follow at a later date.

An Explanation of the Construction of Formulae

A Formula is Not a Mysterious Creation of Higher Mathematics, But Merely a Convenient and Simply Remembered Way of Stating the Rules of Procedure for Every-Day Problems

By T. H. FENNER, Associate Editor

ONE would think that a formula was self-explanatory, but it is surprising how many men use these things daily, without having any clear conception of the principles involved. Machinists, power plant men, and sometimes even draughtsmen, are content to take a set of letters and apply figures to them in the solving of everyday problems, not having any idea of how these combinations of letters have been derived, or what they stand for.

To begin with, a formula is simply a convenient means of stating a rule, which would be long and clumsy to write or remember in its original form. The derivation of this rule may be lost in the realms of higher mathematics, where none but the highest of highbrows may soar. That, however, does not prevent the average man from having an intelligent idea of the various factors contained in the formula, and their relation to one another. If the aforesaid average man had this knowledge he would not look so puzzled when a formula is presented to him in a slightly different guise to that with which he is familiar.

We have said that a formula is an abbreviated form of a rule, or statement. It is that, but it is also something more. It is a statement that the multiplication or division, subtraction, addition, or, perhaps, all four operations, on one set of factors, produces a result which is the expression of another factor. For instance a man wishes to know the size of spanner necessary to slack off a 3-4 hexagon nut. There is a rule for getting the size of the spanner across the jaws. The width of the spanner across the jaw must be equal to the diameter of the nut over the flats. Now this width is 1¼ inches, which is arrived at by taking the diameter of the bolt = ¾, adding to it half the diameter, and adding ⅛ inch. This rule applies to all nuts, so should be remembered. So to make it convenient we put it in the form of a formula thus: $D + \frac{1}{2} D + \frac{1}{8} = W$, or else

$\frac{3D}{2} + \frac{1}{8} = W$, which is more convenient. Better still is $1\frac{1}{2} D + \frac{1}{8} = W$. All these three expressions give the same result, and mean that when the indicated operations are performed on one side; the resulting figure is the size or quantity required. Thus the diameter of the bolt being ¾, D = ¾, so $(\frac{3}{4} \times \frac{3}{2}) + \frac{1}{8} = 1\frac{1}{4}$.

The Use of Signs

Perhaps to begin with, it is well to get a clear understanding of the various signs employed, to denote the different operations. Many men look askance at formulae, on account of signs being present in them that they have never before encountered. There is nothing to be afraid of for anyone who has mastered the rudiments of arithmetic in any of these characters. However, it is important that the operations be performed in exact accordance with the instructions conveyed by these signs, or results will be materially affected.

The commonest signs, of course, are the plus +, and minus —. Plus before a number means that that number is a positive quantity. A minus sign means that the number following is a negative quantity. Where several numbers are involved with these signs between them it means that the sum of all the negative quantities must be deducted from the sum of all the positive quantities. The result may be either positive or negative, and here is where the man with no knowledge of algebra may be puzzled. However, if he just casts his mind to a very familiar phenomenon of our winter climate he will understand it easily. If he looks at the thermometer on his way to work he may find it reads 15 below zero, or as it is usually printed, —15. By eight o'clock it has gone up to —10, and by 9 it has reached zero. At 10 it reads 5 above, or +5, and stays there till 1 o'clock p.m. Then it comes down 5 degrees every hour, till at 5 o'clock p.m. it reads 20 below, or —20. Now, the average temperature for the 11 hours would be found by adding the reading at every hour and dividing by 11.

Now the sum will be $-15 + (-10) + 0 + 5 + 5 + 5 + 5 + 0 + (-5) + (-10) + (-15)$.

This will give $-55 + 20 = -35$

$\frac{-35}{11} = -3.18$, or an average temperature of slightly over 3 degrees below zero.

Now, if we imagine any other body or figure or scale beside the thermometer as having a positive value, a zero

point, and a negative value, there will be no difficulty with the plus or minus.

The multiplication sign is occasionally a stumbling block to the novice, as, instead of using invariably the $\times$, the sign is omitted altogether, or a small dot, something like a decimal point, is used. Where the signs are omitted altogether is when a literary formula is used, but the dots are used between numbers. A figure before a bracket as 3(6x9), means that the product of 6x9 must be taken 3 times. Letters denoting values when placed together, as PLAN in the well-known formula for horse power, are read as $P \times L \times A \times N$, and an expression like 323.4.64 would read $323 \times 4 \times 64$. However, this latter method is not used very generally, either the $\times$ sign being used, or the sign omitted altogether.

The division sign is written in a variety of ways. The best known, of course, is the $\div$ sign, which is the one we first become acquainted with. Then there is the line used as in fractional quantities, as $\frac{2}{4}$ which means that two is to be divided by four, or $\frac{8 \times 11}{6}$ which means that the product of 11×8 is to be divided by six. Again a line is sometimes used as 12/2, which means 12 is to be divided by 2.

These four are what might be called the cardinal signs. There are several others which must be made familiar to the eye, and their meaning to the memory, so that when they are encountered in formulae, there will be no difficulty in arriving at the correct solution.

Of these, the various forms of brackets are among the most important, and are often stumbling blocks to the tyro. Their meaning and the way in which they are used must be thoroughly understood, or correct solutions will be a matter of chance instead of certainty. Bracket signs are classified as follows: The parenthesis (), the bracket [], the brace $\left\{ \right.$ $\left. \right\}$, and the vinculum ——. The generic term covering them all is " signs of aggregation ", and the meaning conveyed by any of them is that the numbers enclosed between them are to be simplified before any other operation is performed.

Take an expression such as $A = \frac{1}{2}(h+b)$, substitute figures for the letters, say, $A = \frac{1}{2}(3+5)$. This means that the sum of 3 and 5 multiplied by ½ will give the value symbolized by A. Take another: $4 + 6(8 \times 4 + 5) - 2 = A$. Now, here is where a very important rule is illustrated, in connection with the multiplication sign. Two numbers connected together by a multiplication sign must be simplified before those connected by any other signs. In this case the solution step by step is, taking inside the brackets first, the product of 8 and 4, added to five, multiplied by 6, plus 4, —2.

The work is:

$4 + 6(8 \times 4 + 5) - 2 =$
$4 + 6(32 + 5) - 2 =$
$4 + 6 \times 37 - 2 =$
$4 + 222 - 2 =$
$226 - 2 = 224.$

Now, if the rule as to multiplying is not observed, the result will be entirely different. Suppose we were in simplifying the term in the brackets to add 4 and 5 before multiplying by 8, see what we should get.

The work would then be:

$4 + 6(8 \times 4 + 5) - 2 =$
$4 + 6(8 \times 9) - 2$
$4 + 6 \times 72 - 2$
$4 + 432 - 2$
$436 - 2 = 434.$

Now, when simplifying a formula in which several terms are bracketed, always simplify the terms in the inner brackets first.

Take the formula for finding the area of a segment of a circle, or rather one of the formulae, of which there are several.

$A = \frac{1}{2}[lr - c(r-h)]$

Substituting figures $A = \frac{1}{2}[8 \times 4 - 3(4-2)]$

Simplifying $A = \frac{1}{2}[8 + 4 - 3 \times 2]$
$= \frac{1}{2}[32 - 6]$
$= \frac{26}{2} = 13$

Take another a little more complicated, as follows:

$$x = 4\left\{3 + [6 \times 9 - (2 + 4 + 3 \div 3)]\right\}$$
$$x = 4\left\{+[6 \times 9 - 3]\right\}$$
$$= 4\left\{3 + [54 - 3]\right\}$$
$$= 4\left\{3 + 51\right\}$$
$$= 4 \times 54$$
$$= 216$$

The rule to observe always is to simplify the expression in the innermost bracket first of all and when simplifying any expression to perform the indicated multiplication first, and the addition and subtraction afterwards. We have not dealt with the last sign of aggregation, the vinculum, because it is not used as a rule except in connection with the root or radical signs. We will consider these, and the index signs, and then give some examples of the use of the vinculum.

The radical and index signs are used when a number is to be reduced to a primary number, or root, from a higher power, or to be raised from a root to the higher power. The radical sign $\surd$ before a number indicates that the square root of that number is to be extracted. The sign with a small figure on the side indicates that the root corresponding to the number is to be taken. Thus $\sqrt[3]{}$ indicates cube root, $\sqrt[4]{}$ indicates fourth root, $\sqrt[5]{}$ indicates fifth root and so on.

Conversely, the small or index figure placed above a number indicates that the number must be raised to the power indicated. Thus 2^2 indicates two taken two times, 2^3 indicates two taken three times, 2^4 means two taken four times, etc. Now sometimes an index may be seen like the following: $5^2/_3$. That means that the cube root of five squared is required, and could be written $\sqrt[3]{5^2}$.

There is no need to perform the actual arithmetical operations, for there are tables published which save all that labor. All one would need to do would be to turn up the table, see the square of 5=25, and the cube root of 25=2.924, etc. Now the vinculum is used when the root of several numbers is required. For instance $\sqrt[3]{(8x9) - 7x6}$ means that the cube root of the product of 8x9 minus the product of 7x6 is to be taken. Take the formula for the approximate operimeter of an ellipse, which is

$$P = \pi\frac{\sqrt{D^2 + d^2}}{2} - \frac{(D-d)^2}{8.8}$$

That is a good example of the use of the vinculum, the bracket, and the index figure, coupled with the use of a sign which is met with almost constantly. That is the Greek letter π, pronounced pi, and used to denote the figure with which the diameter of a circle must be multiplied in order to find the circumference. This is a constant quantity 3.14159, commonly written as 3.1416, or if expressed in fractions as $\frac{22}{7}$, which is not so accurate, and therefore less used. In a circle of diameter d, the circumference is πd, or $2\pi r$, where r is the radius.

There are several other Greek letters in common use by mathematicians, which cause the ordinary man to throw up his hands and retire when met with. However, there is no end of this. They are merely used as symbols and are no more mysterious than the ordinary Arabic figures.

For instance, there is the Greek letter Φ, pronounced theta. This is nearly always used to denote an angle. For instance, if we are engaged in solving some problem which involves an angle of 35 degrees, instead of writing this in full every time we came across it, the letter Φ would be employed. If we have more than one angle another Greek letter is employed for the second angle, the letter Θ, pronounced phi. Many other Greek letters are used, but probably these are sufficient for the time being. All the writer wants to show is that there is no need to look upon a formula as being unworkable because some of the signs are not familiar.

As to the derivation of formulae, the full understanding of these often entails a knowledge of first principles beyond the ken of the non-mathematical. However, many of the every-day formulae in use by machinists, power house men, etc., are easily traced back to their beginning, and it is useful practice to get in the way of doing this. It helps a man to known why a thing is, in addition to knowing that it is. The mental stimulus obtained by reasoning things out is also a benefit. For instance, many machinists

know that the speed of the last shaft on a train of gears is equal to the speed of the first shaft multiplied by the diameter of all the drivers and divided by all the followers. Why should it be? Suppose we have a line shaft running 240 revs. We have a 12-inch pulley driving a 24 on the second shaft, and a 10-inch from that driving a 25 on the third shaft, and a 6-inch driving a 12-inch on a fourth shaft. Let a, b, c represent drivers and d, e, f the followers. Then $\frac{a, b, c}{d, e, f} \times 240$ will be speed of the last shaft. That is $\frac{12x10x\ 6}{24x25x12} \times 240 = 24$.

That formula is simply a statement of the ratio of the first speed to the last as can be seen by taking each shaft separately. The first shaft goes 240 revs. The ratio of the gear on the first shaft to that on the second 12:24 or 1:2. The second shaft, therefore, goes $\frac{240}{2} = 120$. The second ratio is 10:25 or 1:2½. Therefore the third shaft goes $\frac{120}{2\frac{1}{2}} = \frac{240}{5}$ $= 48$. The last ratio is 6:12 or 1:2. That gives $\frac{48}{2} = 24$ as the final speed. Now the ratio is 24:240 or 1 to 10 for the whole range. The first ratio was 1:2, the second 1:2½ and the third 1:2. Multiply these together, 2x2½x2, gives 10. Is it plain now why all the followers divided into all the drivers give the required speed? The same rule applies to the change gears on the head of a lathe. The diameter of the gear on the driving spindle bears a certain relation to the driven gear on the stud. The driver on the stud bears a definite relation to the driven on the lead screw. How is this expressed? Let the spindle driver be called "A," the driven gear on stud "C," the driver on stud "F," the driven on lead screw "D". The lead screw has "G" threads to the inch. The number of threads to be cut are "N."

Clearly, the threads cut per inch will depend on the ratio of "A" to "C" and "F" to "D." The other factor will be the pitch of the lead screw. Now if we have a gear on the spindle with 21 teeth, and the driver "F" on the stud has 60 teeth, while the driven gear "C" on the stud has 42 teeth, the driven gear "D" on the lead screw 72 teeth, we can find the ratio of the lead screw speed to spindle speed. Thus $\frac{42x72}{21x60} = \frac{12}{5}$. That is a ratio of 2 2/5 to 1, so that for every five revolutions of the lead screw we get 12 revolutions of the job. Now if the lead screw has five threads to the inch the cutting tool will travel one inch along the job while the leading screw turns five times. But while this has taken place the job has turned 12 times, thus cutting 12 threads to the inch. All this is expressed by the formula $n = \frac{c \times h \times g}{a \times f}$.

The next time you have to cut a thread see if you can realize the relation of the spindle speed to the threads cut on the job.

Take the good old formula for horsepower, so familiar to most power house men. Horse-power is a rate of doing work. Work is force, multiplied by displacement. The steam pressure is the force and the piston speed is the displacement. Work is measured in foot pounds, horse-power in foot pounds per minute. Hence the piston speed per minute multiplied by average mean pressure is work in foot pounds and divided by 33,000 is horse-power. Thus we get the familiar $\frac{PLAN}{33,000} = H.P.$ Now if we saw it written C P = I.H.P. it might cause wonder, but just think. In an automatic cut-off stationary engine, the only variable is the pressure. If we take the stroke cylinder area and number of strokes and multiply them together, and divide by 33,000, we get a decimal quotient, which has only to be multiplied by the pressure to give the required horsepower. Surely, a time-saver.

There is nothing new in this article to many of us, but to quite a few who have been discouraged from pursuing a line of study through encountering a strange formula, it may serve to lighten an otherwise dark spot.

Canadian Machinery Drafting Course, Part III

In This Third Portion, We Discuss Lettering and Section Lining. Neat Lettering Always Helps the Appearance of a Drawing, So Our Advice Would Be, Study This Portion Well

By J. H. MOORE, Associate Editor Canadian Machinery

BEFORE entering this third portion of the course, let us commence with a good-natured warning to students in general: "Do not yield to the inclination of speed only, but be content to travel the road carefully and at a natural gait." We will try and touch only on the absolute essentials, but in this portion especially, where we intend speaking of lettering and section lining, undue haste would be a very bad mistake. For this reason we ask the reader to study this portion with extreme care, especially the section lining department, for once the principle of the idea is grasped the rest will come easily.

In regard to the lettering. There is a belief in certain circles that lettering is non-essential to a mechanical drawing; in fact the writer of this article, personally, heard a certain chief draftsman give instructions to one of his staff to use a fountain pen for lettering and dimension purposes. When asked his reason for such a command the reply was, "It saves so much valuable time." True, perhaps it saved a little time in the drafting department, but what about the shop end of it, where the workmen had to decipher the lettering and dimensions? A system such as spoken of is carrying the time-saving idea too far,

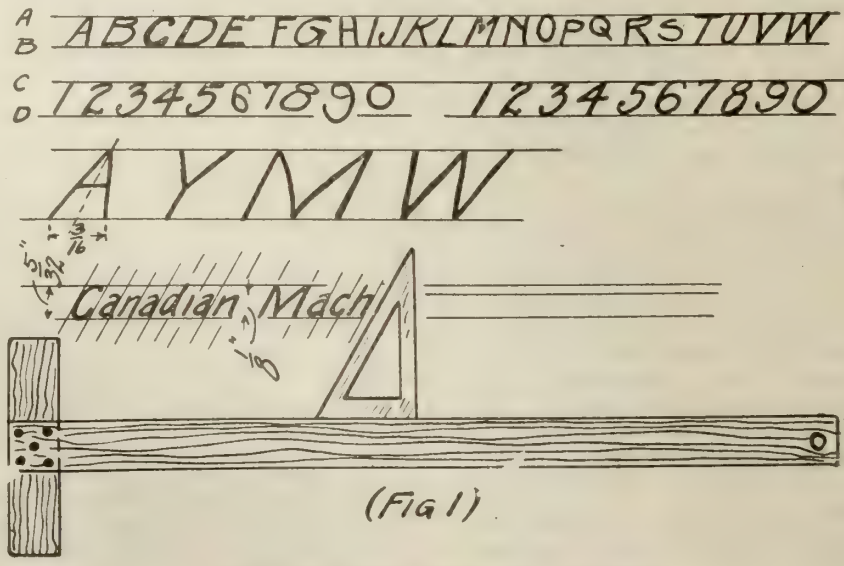

FIG. 1—A SHORT LESSON ON LETTERING.

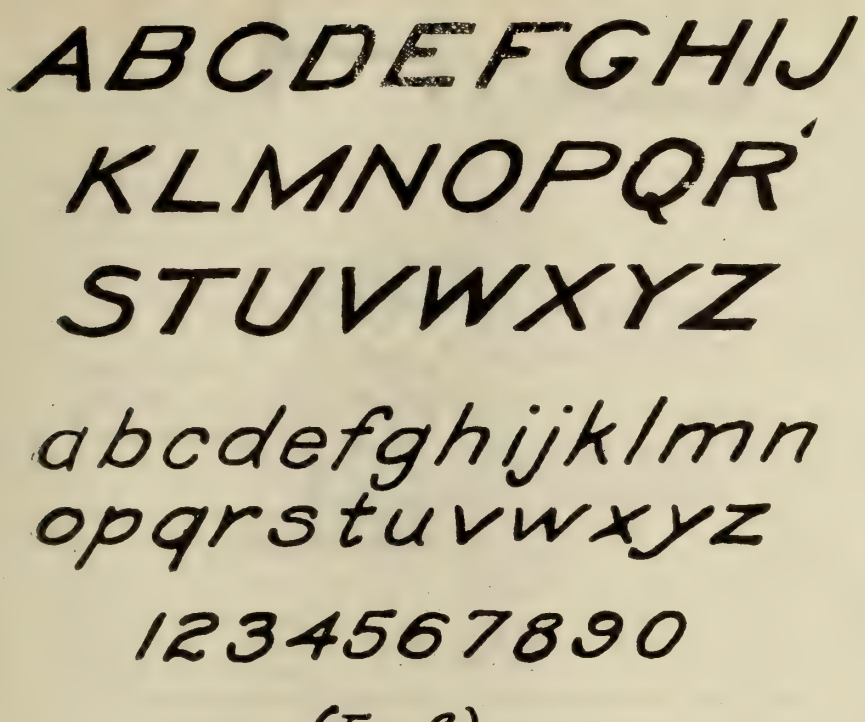

FIG. 2—THE STYLE OF LETTERING TO BE USED.

for a neatly executed drawing, with poor lettering, will never pass muster, in fact the effort spent in making the drawing neat was time wasted, if at the finish the dimensions are carelessly placed and undecipherable.

Still, there is another danger, just as glaring as the one already spoken of. How often we see a drawing, where all the time seems to have been spent on the lettering, while the drawing portion is left commonplace, and perhaps even shows lack of care, yet the lettering is not only perfect, but of the fanciest design possible to make, sometimes, in fact, work that a show-card writer would be proud of. It is therefore of the double danger that we would warn students. We do not wish to take up our readers' time carrying them through a long painstaking course in lettering, and yet, because we only intend mentioning two styles of lettering we do not wish them to run away with the idea that lettering is non-essential. If the two styles illustrated further in this portion are practised earnestly, students will be sufficiently equipped in the ground-work at least, and have ample knowledge for average conditions.

In the up-to-date drafting room of to-day, wherever possible rubber stamps are used to take the place of the lettering. This particularly applies to the title block, and as the type used is much better than the hand printing, such a method is not only an improvement, but a decided timesaver. For the purpose of our course, we will, as before stated, keep to two styles, namely the sloping Gothic letters, and the block type.

Fig. 1 illustrates how students may practise the Gothic style with the aid of T-square and triangle. To start with it is important that a good pen be used for the purpose. A Gillott's No. 303 pen is ideal for such work. For the purpose of our course we will set a standard to the height of the lettering. This height is clearly shown on the sketch Fig. 1, case letters as they are called, are to be 5-32 in. high, and the smaller, or lower-case letters as they are called, are to be ⅛ in. high. As regards the spacing horizontally, no real definite rule can be given, for it is simply a matter of the general appearance that counts. Students will become more proficient in this spacing the more they go on, and the more they practise the more their eye will discern uneven spacing. What would perhaps help the student more than anything else is to remember these points, that W is the widest letter, M and T the next widest, then A and B. The narrowest letters are I and J, after which all the rest are about equal. A short space of time memorizing these facts will help the student considerably.

Before beginning to letter, draw horizontal guide lines with your T-square to serve as a guide for the tops and bottoms of letters, see lines A, B, C, etc., on Fig. 1. The letters should be made to extend fully up to the top and down to the bottom. They should not fall short of the guide lines, for if they do the lettering will appear ragged and uneven.

It is also very important that the letters have the same inclination. For example letters A, B, C, D and E are shown at correct inclination, then F, G, H, etc., are alternately put at various angles to illustrate the point of irregular slope, also the importance of keeping to the proper guide lines is illustrated by purposely not reaching the proper lines, to show up the irregular and ragged effect.

To secure the regular slope, use T-square and 60 degrees triangle, as shown in the lower portion of Fig. 1. In lettering make the backs and sides of the letters parallel with these sloping guide lines. A few points regarding the construction of a few particular letters. On line 3, Fig. 1, enlarged twice the actual size, are shown letters A, Y, M and W. To print A draw the centre line at the regular slope; from the apex of the letter draw a line almost perpendicular as shown, and make the distance across the bottom of letter about 3-16 in. wide. Regarding the other letters illustrated, students, by studying the same, will easily grasp the style and principle of design involved. Our advice to the student is this: follow the copy closely, keep on practising, for one can learn more about the lettering subject by actual practice than by any written instruction. Fig. 2 illustrates the complete alphabet and numerals. We now leave the Gothic style and pass on to the block design.

Fig. 3 illustrates the block type, and while at first sight it looks a difficult style, it is in reality very simple, for it is a mechanically produced style of lettering, the T-square and triangle completing the entire letter. The letters are to be made 5-16 in. high and ¼ in. wide, except M, which is 5-16 in. wide, and

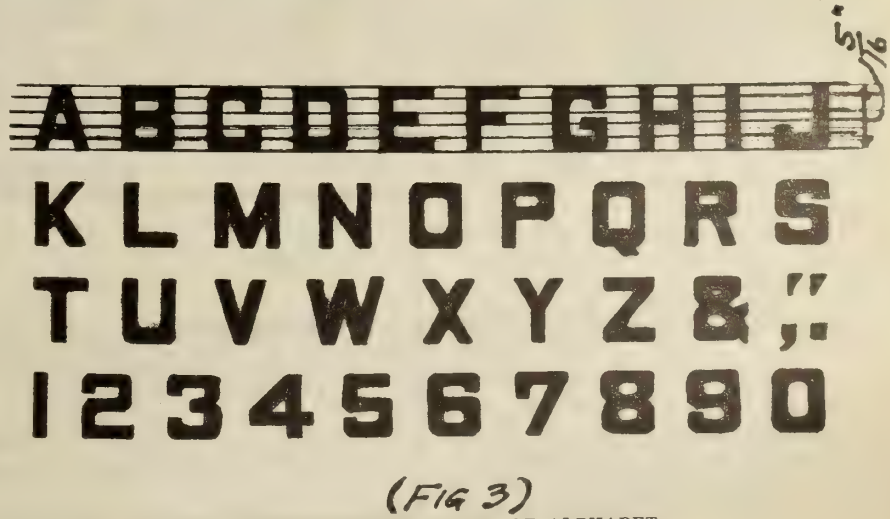

FIG. 3—THE COMPLETE BLOCK OF ALPHABET.

W, which is ⅜ in. wide. The thickness of all lines is to be 1-16 in. The distance between any two letters of a word is 1-16 inch, except where A follows P or F; where V, W or Y follows L, where I follows F, P, T, V, W or Y, where T and A are adjacent, or A and V, W or Y are adjacent. In this case the bottom extremity of A, and the top extremity of F, T, V and W are in the same vertical line, etc. In other words, as before stated, practice will allow the eye to discover proper spacing.

Since these letters are composed of straight lines they can be made with T-square and triangle throughout. The student should draw six horizontal lines 1-16 in. apart in lead pencil, to represent the thickness of the letters at the top, centre and bottom: then by use of the triangle he should next draw the letters and the spaces between them, also in lead pencil. Having the letters all laid out, he can then easily ink them in. Use the ruling pen for this purpose. Students had better ink in all vertical lines first, next the horizontal lines and lastly the oblique lines. By such a method he lessens the chances of blots, also follows the building up of the letters in their natural sequence. Once more the importance of practice work is impressed upon the student if he would become proficient in this work. Leaving the student at this point to practise these two styles of lettering at his leisure, we will go on to section lining, its principles and purposes.

Sections and Section Lining

When we speak of a section through a piece of work, exactly what do we mean? We mean simply this, that to show clearly what otherwise would all be hidden and represented on the drawing by dotted lines, we cut clean through the centre of things, or in fact through any portion of an object, or objects, to show its various details. To make these points even more plain than ever, we section line the various parts by certain lines which represent the material from which they are made. Unfortunately there is no universally adopted standard, thus a certain combination of lines in one drawing office may mean steel, but in another office they might use the same combination of lines to represent some other metal, for instance cast iron. However, in the majority of offices, the combination of lines are alike, and on our plate No. 3, are illustrated these various shadings or section lines, as they are called. Under each space is given a letter of the alphabet, and at the end of this article we have placed in table form the letters, and what each particular section represents. Students should familiarize themselves with these various sections, so that at once they can tell what material a part is made of by its section linings. Where lines are too thin to show section lines they are simply blackened in, as shown on one of the portions of Fig. 4. These blackened sections are most frequently employed for sectional views of structures composed of plates and rolled sections, such as I-beams, angle irons, rail bars, etc.

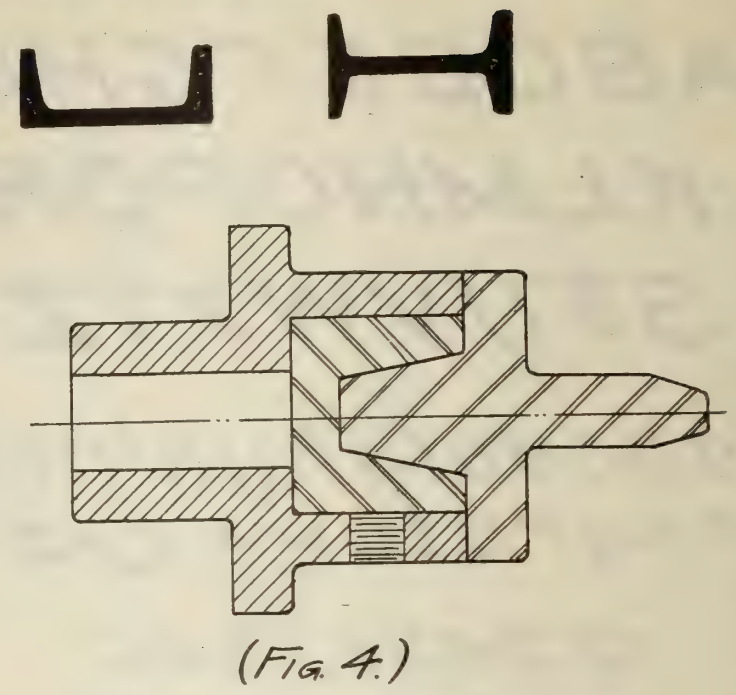

FIG. 4—THE PRINCIPLE OF SECTIONING ILLUSTRATED.

On going further into the drawing question, we will find that section lines do not always run in the same direction, for example refer to Fig. 4. This view shows that there is more than one piece to the section given. It is a general rule among draftsmen that each part of the same piece is section lined in the same direction, irrespective of its community of the section, so that by this means, after one has followed up the section method further, they can easily ascertain if at various parts of the section the same piece appears. In a later plate on this course, the student will have to make sectional views from straight sketches, but of course, before we expect him to do this, further information will be given him on this important subject. At the present time the chief idea is to familiarize students with the various lines used in section lining, and their meaning.

The next plate will go on to practical use of the instruments, as applied to geometrical drawing, and while two or three plates will be taken over in this branch of the subject, it is only because it is absolutely essential that the student get this groundwork before going further into the mechanical drawing question. As stated before, we will not attempt to make this a long, detailed course, but will carry the student along as fast as we possibly can, with the knowledge that he has a chance to follow us. It would be foolishness to proceed faster.

Might we close this portion of the course by asking some questions? Do you like this course? Do you believe it worth while? Is it doing you any good? If so tell us about it by letter. We would like to know that our intentions are being realized, namely, to provide an interesting course of use to the shop worker. Are there any points you would care to suggest? We should like to hear them. Last, but not least, keep sending on your work. We are busy receiving replies now, but we want still more. How about it? Do you want to earn one of the prizes? If so send your stuff along. It may be your plate will land the prize. Referring to plate No. 3: proceed to lay out the border lines as before. Then divide evenly into the sizes given on the plate. Draw up each section as near to the original as possible. The section of this plate devoted to the lettering is left blank for obvious reasons, namely that we wish to see your progress on this subject. To show us this progress proceed as follows: where

Tear off and send with drawing

Name .....

Address .....

Position .....

Firm's name.....

P is marked make two guide lines 5-16 in. apart, and draw in the words, Canadian Machinery, in block style lettering. Where Q and R is marked print in sloping Gothic capitals 5-32 in. high these words: Canadian Machinery has a motto well worth while. "To make their paper better this week than last week, advancing all the while." At S and T, make double guide lines, and place these words, in sloping Gothic, with capitals and lower case letters, "The price is $3.00 per year, let us have your subscription now."

Regarding the spacing, that is strictly up to the student. Make it as good as you know how. From your plate we will see how well you have read the instructions. Above all, send the plate in.

Table form illustrating what materials the various section lining represents:

A represents cast iron.
B represents cast steel.
C represents malleable iron.
D represents wrought iron.
E represents wrought steel.
F represents copper or zinc.
G represents brass or aluminum.
H represents composition.
I represents insulating material.
J represents water.
K represents wood.
L represents brick.
M represents fire brick.
N represents concrete blocks.
O represents concrete.

Fundamentals of Thread Milling

THE Smalley General Co., Inc., of Bay City, Mich., have a few things to say on the above subject, which, no doubt, will be of interest to readers in general. They comment as follows:

It is not generally known that thread milling is not a new process in industrial practice. Machines of this type were in use in this country as far back as the Civil War days. They were crude and light. It has only been within comparatively recent years that really successful thread millers have been developed.

Prior to the rapid growth of the automotive industry and the outbreak of the war in Europe in 1914 the use of thread millers was quite limited. For one reason, the machines were not as efficient as they should have been, and for another reason, industrial practice tended to move in the accepted groove. Manufacturers naturally enough did not care to break away from tried and accepted methods of cutting threads for a new process, which they then regarded as an experiment.

While the impetus given the machine tool trade by the growth of the automotive industry helped to perfect and make thread milling better known, it was really the European war which gave the big impetus to thread milling and put it on a solid and accepted footing in the machine tool trade.

The enormous demand for munitions, the cry for speed and more speed in manufacturing methods and the insistence upon accuracy and minimum scrap made the use of thread millers imperative in various lines of munition work which ranged all the way from threading artillery hub caps to threading sixteen-inch shells and base-plugs.

In the rigorous tests and trials to which thread millers have been put in the past five years on the heaviest and most exacting work, we believe that we can safely say that the machines have fulfilled the estimates of their makers and satisfactorily met the requirements of purchasers.

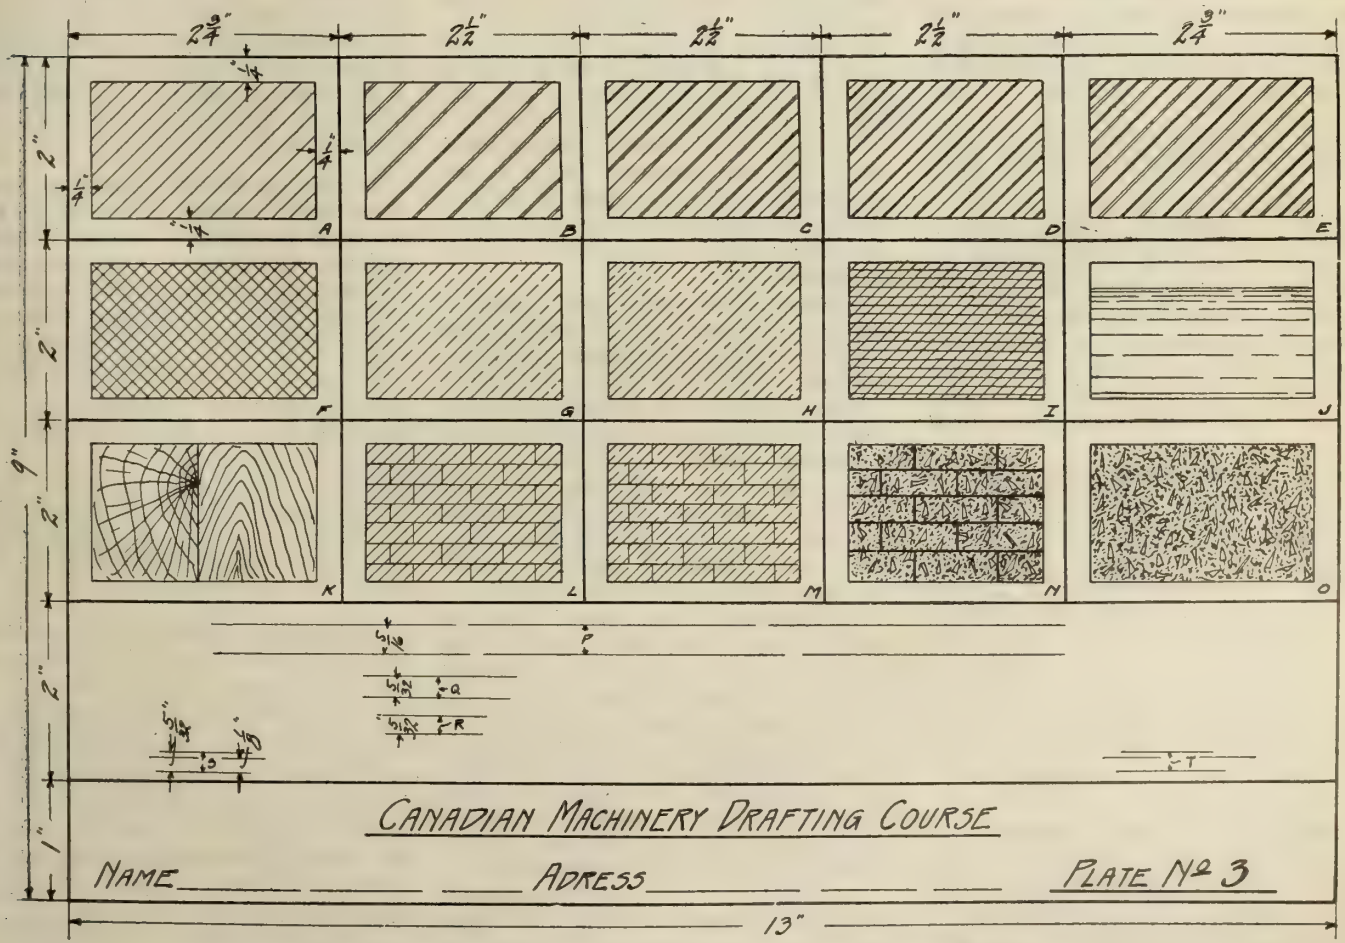
In describing a thread miller it will perhaps be best to begin with the single purpose machine designed for production work. This is the simplest type of machine. It is the bare machine reduced to its lowest terms.

The bed is of lathe type. The main head is cast solid with it. This insures great rigidity and perfect alignment.

The spindle in the main head is hollow. In a typical machine of medium size the spindle is 38 inches in length with an opening through the centre 6 inches in diameter.

Chucks for holding the work are bolted to the flange of the main spindle so that any type of chuck can be used.

Located on the ways of the machine



HERE WE HAVE PLATE NO. 3—SO GET BUSY AND SEND IN YOUR WORK PROMPTLY.

is the bottom slide, which in turn carries the top or cross slide. This cross slide is controlled in relation to the bottom slide by means of a micrometer screw by which the diameter of the thread is determined. The top slide carries the milling spindle. The milling hob is held on this spindle by means of a tapered arbor and a draw in bolt.

When a multiple tooth hob is used the thread is completed at one revolution of the work, but when a single cutter is used as many revolutions are necessary as there are threads.

During the milling operation, while the work held in the chuck makes one revolution, the milling head is moved back on the ways by the lead screw, a distance amounting to the pitch of the thread to be milled.

Either internal or external, right or left hand, straight or tapered threads can be milled. With a thread miller it is not possible to mill absolutely square threads. A very slight angle is necessary for clearance. Acme threads, for instance, can be milled.

In operations where internal threads are to be milled the diameter of the hob must, of course, be slightly less than the diameter of the part to be milled in order to allow for ingress and egress of the hob.

This, of course, is not to be taken as meaning that a large hob must necessarily be used if the diameter of the piece to be milled is large. While usually a hob of large diameter would be used for milling an internal thread of large diameter we want to make the point that there is of necessity no particular relation between the diameter of the thread and the diameter of hob used.

The single purpose machine just described is provided with milling speed only.

The general purpose type of machine is provided with turning speeds as well. The turning speed bears a constant relation to the milling feed, so that it is fast for small work and slow for large. This enables surfaces to be turned true with the thread and gives perfect alignment when screwed together. It also saves an extra operation on some other machine.

In the type of thread miller, which is designed for both milling and turning speeds, the changes of speed and also the shift from neutral to milling or turning speed are simply obtained by shift of levers. By a system of gears in combination with the three-step cone pulley as high as eighteen speeds can be instantly obtained. The only loose gears are those required for the lead screw to change the pitch of the thread to be milled. The lead screw is driven and changes of pitch are obtained as in a lathe.

Just beneath the main spindle is a combination of gears actuated through clutches which controls either the high or low speeds. The low speed is for milling and the high speed for lathe or turning speed. In order to govern the peripheral speed of the surface to be milled a system of sliding gears is located in a gear case base forming a box leg which supports one end of bed. These gears run in oil.

It should be noted that neither hob nor tool need be removed during operations.

Thread millers are either belt or motor driven, depending upon the circumstances of the case.

For threads of 12 per inch or more a direct driven spindle may be used. For coarser threads a back geared spindle is always used.

Milling speeds depend upon material milled, rigidity of machine, quality of hob and finish required. In steel and cast iron, hob manufacturers recommend a cutting speed of 80 feet per minute and .004 feed per revolution with a hob 2⅛ inches in diameter, which gives a milling feed of approximately 6 inches per minute. As a rule a properly constructed thread miller should run in such material about 9 inches per minute without distress

In thread milling it should be remembered that the finishing and roughing cut are taken at the same operation. It therefore follows that the slower the milling feed the better the finish. And so when a polished finish is required it is well to slow the machine down to 5 or 6 inches per minute, or else take a roughing cut and then a light finishing cut on second revolution. This is seldom necessary. With milling speeds running from 9 to 12 inches per minute the limits can be held to .001 or .002, depending upon circumstances.

In annealed high-speed or hard alloyed steels the usual milling feed is from 2 to 3 inches per minute with cutting speed of 35 to 45 feet.

The limit of a properly built thread miller with the requisite heft for the operation in hand is the limit of the hob. There is no excuse for distress or chatter in the machine at any speed the hob can stand.

Experience has shown that, given a sufficient volume of thread cutting along lines for which thread millers are designed, the installation of thread milling machines will reduce costs, increase production and improve accuracy of finished product.

It can be shown beyond the peradventure of a doubt that the use of thread mllers in many cases is more than justified on the ground of saving in scrap and elimination of tool room expense.

The advantage to be derived from the use of thread millers on the score of increased production because of greater speed than present methods varies. In certain types of operation thread milling will cut the time of operation by present methods enormously. In other types of operation the speed of thread milling is not much superior to present methods, but the quality of work is much better and the saving in scrap large.

It appears to us that manufacturers of thread millers have laid too much stress upon the advantage of speed. In many cases the real advantage of installing thread millers lies in the saving secured by accuracy of finished product. A milled thread is very accurate and so-called "drunken threads" never occur. Accuracy and little or no spoiled work coupled with minimum scrap and saving in tool room expense make thread milling superior to present methods without the benefit of greater speed.

A fair way to put it is this: Where accuracy is not required and most any old thread will do, the thread miller has not, in many cases, a production capacity superior to other methods. When accuracy is required the thread miller is far superior in both quality and quantity production.

It is usual practice for manufacturers to put the thread milling operation last, where possible, because it is the operation with the least scrap.

Thread millers are practically foolproof. Highly skilled mechanics are not needed to operate them. The labor used on other automatic or semi-automatic machines is quite competent to handle thread millers.

As rapidly as possible, all the unused shells in Germany are being converted into commodities more useful to peacetime pursuits. The procedure, carried out under orders from the Allies, is to extract the explosive, remove the copper rotating bands, and then turn the empty cases over to the foundry. There they are melted up by the open-hearth process. A huge electrically-driven charging machine picks up a charging box full of cases, carries it on the end of a beam to the furnace, thrusts it in and dumps the box by inverting it. Cast into ingots, the steel is then sent to the rolling mill.

The famous French aviatrix, Baroness de la Roche, recently flew to an altitude of 15,700 ft., driving the little Caudron biplane with which the late Jules Vedrines landed on a department store roof last January. The performance has been checked by a commission from the French Aero Club, giving the Baroness the women's altitude record. It was formerly held by Miss Ruth Law, of America, who climbed to 14,701 ft. at Peoria, Ill., in 1917.

Rich deposits of potash, discovered on the island of Sicily, are said to remove forever the world's dependence on Germany for that substance.

Sodium as a conductor for electricity was considered seriously by the Germans during the latter part of the war, due to the scarcity of copper and other metals commonly used for this purpose. On the basis of weight, sodium has three times the conductivity of copper, but because of its low melting point, is difficult to use for carrying electrical currents. To overcome this drawback, the Germans proposed to use it in hollow iron tubes. An almost inexhaustible supply of sodium is declared to exist in the salt beds of Germany.

WHAT OUR READERS THINK AND DO

ADJUSTABLE BORING BAR HOLDER

The accompanying sketch is an adjustable boring bar holder for milling machines, but is useful for other machines as well.

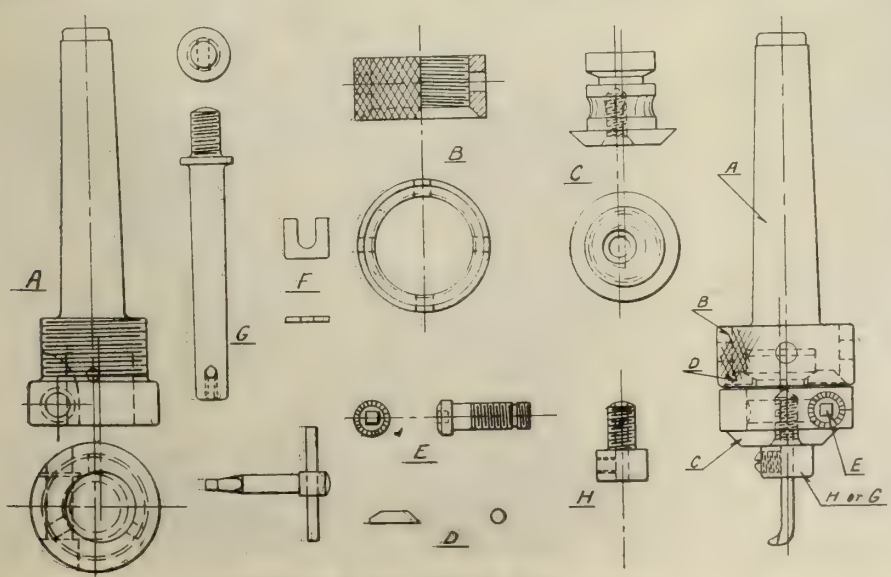
The part A is turned to fit a standard taper and threaded on the outside to take the collar B. This head is bored out a snug slip fit on part C, the boring bar holder. In part A, in line with the groove cut in part C, there are 3 holes drilled to take the lock pins D, which are 3 in number, and, as can be seen from the sketch, must be of different lengths. These may be fitted at assembly. Across the head on part A is drilled and countersunk the hole to take the adjusting screw E. Lengthwise of the head the ⅛ slot is cut to take the lock washer F. Around C in line with the adjusting screw hole in part A a thread is hobbed to mesh with the adjusting screw. In the end of C a hole is drilled and tapped to take the boring bar G or the small boring tool holder H. The part B is a knurled ring to lock C in place after adjusting.

To assemble this tool part C is slipped into part A and the pins D dropped through A into the groove in C, after which the lock collar B is screwed on A with its bevel face on the 45° bevel face of the pins D. Next screw in the adjusting screw E and insert the washer F in the slot cut in part A and around the groove cut in screw E, after which peen over the slot in A to hold the washer in place.

To operate the head the boring bar of the necessary size is screwed in part C and the wrench J is used to turn the screw E, which revolves part C in part A until the tool is boring the proper diameter, after which the part B is screwed forward, causing the 30° taper on the pins to draw part C back against part A, which acts as a lock for C.

The hole in part A has been bored ⅛ in. off centre and the hole in C has been drilled and tapped ⅛ in. off centre, giving an eccentric throw of ¼ in. to the boring tool. Any variety of boring bars can be used with this tool.

In our own case the thread on C was hobbed with a standard top, which gave a fairly serviceable job.



DETAILS OF THE BORING BAR HOLDER.

ARBOR FOR LOCOMOTIVE BRASSES

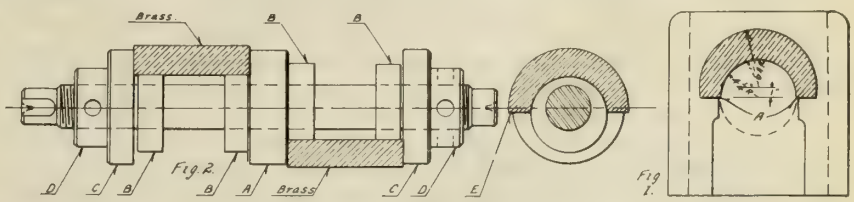
By G. Barrett

The arbor shown is used for turning brasses for locomotive boxes.

Readers will note by drawing of axle box (Fig. 1) that the brass has two different radii; this accounts for the special arbor.

The arbor (Fig. 2) is made from a 4 in. steel bar, with a cast iron collar A shrunk on the centre. There is also four cast iron eccentrics B (Fig. 2) which accommodate themselves to the inside radius of brass and supports same while being turned on the outside.

The brasses are clamped against the fixed collar in centre by two loose flanges C and tightened with units D.



SECTIONAL VIEW THROUGH ARBOR.

By having a locating mark on the fixed collar in centre it is unnecessary to remove the arbor from the lathe when removing finished brasses.

There is no need of heavy lifting as the machinist just puts the brasses in position one at a time and tightens the nuts with a large wrench or tommy bar.

The other view shows a sectional end and the reader will see that the brass projects by the centre at E. This is another claim for a special arbor and is also to allow for machining after turning so as to be a press fit between the webbs A (Fig. 1).

A ship-salvaging "camel" that is blown up like an automobile tire has been invented by a British naval officer, and is already doing good work among sunken vessels. Shaped like a small dirigible balloon, the camel is made of laminations of specially-prepared vulcanized canvas. It is protected by longitudinal rope fenders and provided with flat flexible-steel moving bands. Three air connections at different points make for convenience in handling, and a pressure regulator prevents overinflation. Deflated, the big bags are introduced through porthole or hatchway into the sunken ship, and then air is pumped in until the vessel rises. A special steel clip for fastening to a ship's side allows the external use of the camels if necessary, avoiding the difficult task of placing cable under the hull.

DEVELOPMENTS IN SHOP EQUIPMENT

DUPLEX UNIVERSAL MILLER AND SHAPER

THE Cochrane-Bly Co., Rochester, N.Y., who have been building a Duplex Universal Miller and Shaper for a number of years, have recently made several modifications of the machine, fitting it with single bends only.

The machine is now built as a Duplex Universal Vertical Miller and Shaper; Universal Vertical Miller only; Universal Vertical Shaper only, and a Plain Vertical Miller.

The Universal head on both duplex and single machines adjusts right to left, or left to right the full circle, and the shaper and milling heads adjust independently front and back 40 degrees, and are operative in any position.

The milling spindle has an adjustment of 3½″ with hand feed. A micrometer screw is provided on spindle housing to gauge depth of mill, drill, etc.

The spindle is hollow, and is furnished with draw bolts for holding milling cutters, split collets, etc. Drilling, milling, coring and slotting operations can be performed at any angle, and at one setting of the work.

The shaper arm is adjustable for stroke from 0 to 6″. The tool head is adjustable on the ram, the full circle, and clapper block is operated positively by means of a toggle-link and adjustable dogs. The crank arm or link is made of solid steel, and compensation is provided in the crank pin box to take up the wear on both crank pin and link.

The drive is through a friction clutch pulley, and double cone of gears running in a bath of oil. All gears in the machine are of steel, and the gears in driving train are hardened.

The direction of spindle can be reversed in the machine and it can also be disengaged and revolved freely by hand. A locking pin is provided to lock the spindle when changing cutters, etc.

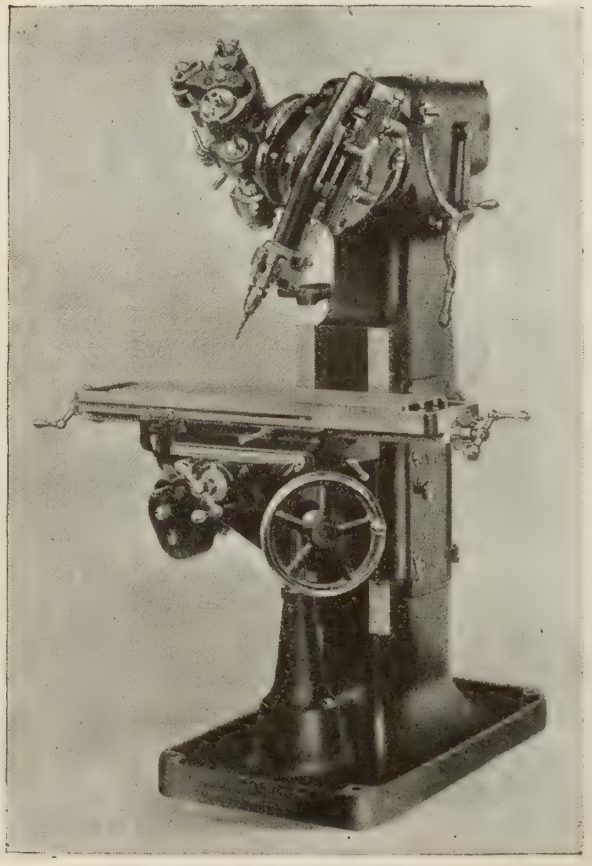
The clutch pulley has an oil reservoir, insuring thorough lubrication for long periods. A cone brake opposes the clutch and engages when clutch disengages, thus bringing the machine to an instant stop.

Five changes of speed are instantly obtained by shifting a lever within easy reach of the operator in working position.

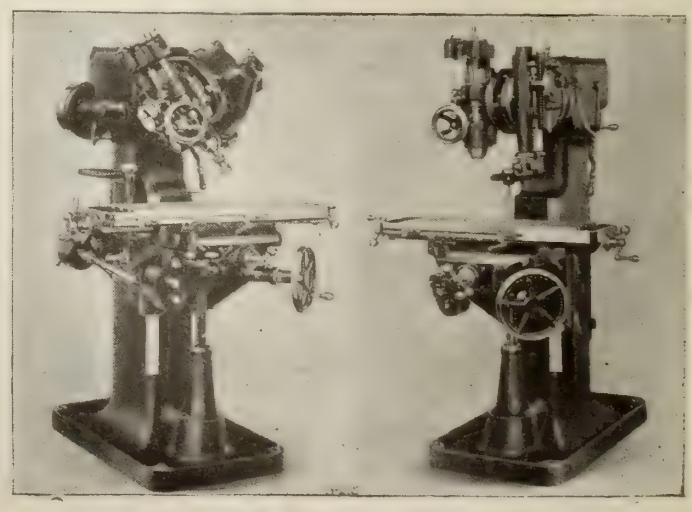
A very essential and important part of the outfit furnished in connection with these machines is the circular table with dividing attachment, and the compound circular table. With these attachments holes in jigs can be drilled and bored on five sides of a square at one setting of the work. Radial slots can be accurately spaced and planned at any angle from the horizontal to the vertical; key ways spaced any number of degrees and minutes and cut in either straight or taper holes or with any desired draft.

Die blocks can be accurately drilled, bored, machined with milling cutter, and slotting tool on all angles, and curves, and filed without removing the work from the machine. By using the circular and compound tables in combination dies and other parts can be machined from any number of centres, and two or more radii blended, and intricate forms and shapes developed with a high degree of precision.

Examples of such work are tools and templates for tire molds, molds for Bakelite and other insulating material. Dies for die casting metal, molds for glassware, battery connections. Dies for blanking and forming sheet metal, metal pattern work, etc. Provision is made on both longitudinal and transverse slides for standard



UNIVERSAL VERTICAL SHAPER.



TWO OTHER VIEWS OF THE MACHINE.

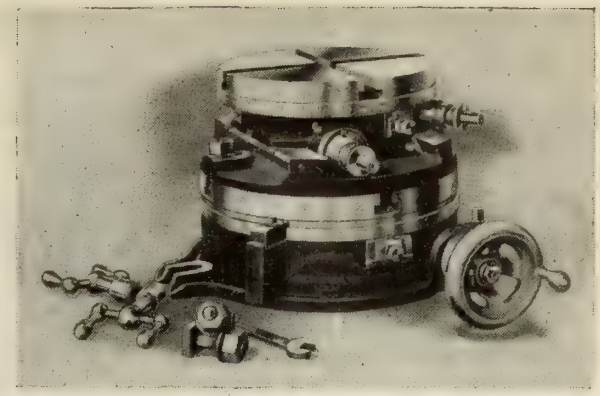
B. & S. Vernier Scale outfit, insuring accurate measurements.

The plain milling machine is provided with ten spindle speeds and twelve feed changes, and will take any of the standard attachments furnished for the Universal machines.

In addition to the circular and compound tables, a plain milling machine vise, drill chuck, spring chuck, collets, sleeves for Morse and B. & S. tapers, draw bolts, centres and expanding arbors can be furnished.

A simple motor drive can be applied to all of the machines.

Principal dimensions of these machines are as follows:
Table inside oil pockets, 9″ x 20″.
Table travel, longitudinal, 18½″.
Table travel, transverse, 9″.
Table travel, vertical, 18″.
Size of tee slots (3), ⅝″.
Adjustment of centre head, 360 degrees.
Adjustment of milling head B. & S., 45 degrees.
Adjustment of shaper head F. & B., 40 degrees.
Speeds of milling spindle, R.P.M., 55 to 330.
Maximum speed of high speed milling attachment, 1,400.
Maximum distance table to spindle, 20″.
Maximum distance table to tool, 18″.
Distance centre of spindle to column, 13″.
Speeds of shaper (strokes per minute), 35 to 150.



CIRCULAR AND COMPOUND TABLE USED WITH THIS MACHINE

Taper hole in spindle, B. & S. No. 9.
Hole through spindle, 17/32.
Feeds per rev. milling spindle, .003″, .004″, .006″, .008″, .016″ and .034″.
Feeds per stroke of shaper ram, .0025″ to .080″.
Speed of drive pulley R.P.M., 500.
Size of drive pulley, diameter and face, 10″ x 3″.
Net weight, standard machine, 2,100 lbs.
Floor space, 57″ x 66″.

"VOLYUM" CENTRIFUGAL PUMP

The Volyum Pump Co., 419 West Liberty St., Cincinnati, Ohio, have brought out a new vertical centrifugal pump, known by the trade name of "Volyum" and intended especially for supplying the coolant for machine or cutting tools. Fig. 1 shows an outside view of the device, while Fig. 2 is a sectional view showing the construction. The impeller is of the open type, mounted on the lower end of the vertical shaft and extending the full depth of the semi-spherical body, there being no contact between the impeller and the body casting. The bearings for the impeller shaft are both above the water line; one of these bearings is formed by the stuffing-box gland that is located just above the impeller, while the second one is in the cap. The drive from the pulley is through two spiral gears, placed at right angles and having a 3 to 1 ratio. The large gear is mounted on the driving shaft and runs in oil in the chamber formed by the cover, this oil serving to lubricate both the shafts and the thrust bearings, as well as the gear teeth themselves. A 3-in. flanged pulley is standard equipment, although a gear or sprocket wheel can be substituted if desired. The pump can be mounted on either the side or end of a machine, as desired, various angles of drive being obtained by swiveling the cover in relation to the body and by reversing the position of the pulley. In order to eliminate the loss of the liquid necessary for priming, the suction pipe is located above the delivery box and the body thus retains a full supply of liquid. The pump is at present made for ¾-in. pipe connections, and has a capacity of from 5 to 22 gal. per minute, depending upon the speed.

The Independent Pneumatic Tool Co. have placed on the market a new improved Thor perfect hose coupling. This style of coupling is disconnected instantly by a straight pull on the knurled sliding sleeves, with which it is equipped.

A full description is given of this fixture in the pamphlet issued by this firm, and those interested should write for one, as this is a decided innovation.

The Problem of the Foreigner

NEWSPAPERS take various views of the struggle going on in the steel industry of the United States. It is all very well for stock brokers to say that the strike is dwindling to an end—to pooh-pooh the whole thing as a half-baked upheaval amongst what they term the "bohunks," and, in short, to tell these "hunkies" if they don't like things here they had better clear out.

The fact is that any movement that can, on short organization effort, pull hundreds of thousands of men from work on a given day, has got to be noticed. It cannot be dismissed with a wave of the hand unless we wish to move across and dwell in a real honest-to-goodness fools' paradise.

Get back to facts. These hunkies were brought to this country by the big concerns that are now fighting them. The steel mills of United States wanted cheap foreign labor, and they scoured Europe for it.

They imported human beings in quantities. They were out to gather up human industrial wheels, not future American citizens.

And so they raked these chaps together—the rag-tag and bob-tail of the continent, and turned them loose on this continent.

They brought with them their racial hatreds and loves, their nightmares of oppression for years gone by, their wild dreams of the day when they would rise up and take possession—for mark you, these hunkies are steeped in the words of Marx and stewed in the teachings of anarchy.

Well, what happens? In this country they find the agitator here. It pays him to agitate better than to work. It is a thousand times easier to earn his bread by the sweat of other men's brows than to have anything approaching moisture decorating his own head.

That influence goes after the foreigner. It is more insistent than anything else. He meets it in the mill. He comes in contact with it when off the premises.

And what do we do for the foreigner? Well, we herd him, regulate him and fine him, and if this fails, lock him up.

We don't want him living on our street, eating in our pet restaurant, going to our club, sending his children to our school. Not much! We herd these fellows, and then our splendidly-made law seeks to regulate them.

Do we do nothing for them? Surely we do. We send officers to search their homes for booze, to inspect their back yards and occasionally we fatten our police court revenues by fining them!

The foreigner is in United States and in Canada. He was, in many cases, urged and asked to come. He is here to stay, and he can be either a decent citizen or a nuisance and a danger. He is not thinking for himself. It is the law of the mob all over again, and unless some mighty big influence is turned loose he will increasingly shuffle off to the nuisance class.

BUT what is the outlook for the foreigner who thinks? Well, here's a true case:—

He was a cobbler—not in a particularly large way. The staff consisted of himself. He bought the stock, cobbled the shoes and collected the cash.

He had come from Italy ten years before and was making his way by hard work. But this cobbler did more than cobble shoes. As I sat there one night waiting for him to finish an odd job, he wanted to know how the British railway strike had been settled—he asked if Asquith had any chance of getting back the ground that Lloyd George had cut from under him—he talked of the lack of interest in the Ontario elections, and had a solution for the world's unrest, in the simple life. And as he hammered and stitched, he reasoned about the folly of our ways—"My wife buys a coat and wears it on cold days. At the end of the winter she puts it away. Next winter she takes it out, looks at it and sees that the cloth is good, lining good—but the men who make the styles have spoiled that coat. It is out of style. By this system they are able to make people go into the market and buy things they do not need. They are able to make people spend money that should go for other necessary things."

And so he talked and worked. That Italian cobbler was, in his way, doing more real thinking than thousands of native Canadians who never seem to have or take time to let their brains settle down to perform the function for which they were created—some real, solid reasoning and thinking.

THE foreigner is in United States to stay, and he is in Canada to stay. He is not going to take a sudden or a violent notion over-night to pick up and clear out.

Canada need not imagine that the problem of the foreigner belongs exclusively to United States. It does not. It exists here. We have it in Ontario and we have it all the way across to British Columbia.

It was strong enough during the stress of war to tie up Alberta coal mining properties, and it was defiant enough to create conditions that would have forced, if possible, Canada's war effort to drift to the dogs.

It is not possible to road-roller the foreign population in North America into a harmless mass that will do a lot of slugging and dirty work and not ask too many questions. It is not possible to keep out the agitator. Root out one to-day and a new one has sprouted for the morrow.

What then?

The best first step is to shut the gate that lets him in. In other words, hand-pick our immigrants. That will at least prevent the problem from becoming more serious. That may be a negative virtue, but it is a **move.**

Then to Americanize and Canadianize them. Big job? Yes. Tremendous!

Well, why bother with it?

For the very simple yet very forcible reason that we've got to or else house a menace and a danger for years to come.

This work must be done by cities, towns, factories, and every other agency we can turn loose upon the foreigner. Play square and firm with him. Remember, we have got to "get him," or he will be a big power in the force that aims to "get us."

Cutting Out the Typo

THE *Literary Digest* has come out with pages on which there has been no typesetting. The pages are photographed from typewritten copy.

Years ago the old printer, when the matter of typesetting machines was mentioned, simply scowled, and if he came down from his scorn far enough to say anything, it was simply, "It can't be done!"

So that settled it. What more was needed than that the old-timer should pronounce it a failure?

But the typesetting machines came, the old Thorn, typograph, monoline, linotype, monotype, and what not. And to-day they are clattering away in offices where the old-timer had counted them out years before.

And now the next move is to get along without them. There has long been a feeling that there was too much repetition work in getting out a paper or magazine. The editors and reporters write or typewrite all their copy, and the machine operators in reality perform the same function all over again to put the matter in type.

The next big step will probably be some method whereby a reporter operating a typewriter keyboard will set in motion the mechanism to make type out of this copy.

On going at it from another angle, some publishers in small places have solved this dual operation long ago. The editor makes his rounds, attends meetings, etc., and then comes in, and instead of writing his copy, operates the keyboard of his own typesetting machine, and at once turns his notes into type. But, of course, these dual-purpose individuals are rather few and far between.

The Joys of Autumn

The autumn is a wondrous time, its glories poets sing; they say it's fifty times as good as winter or as spring. By heck, they rave about the skies, about the tinted trees, and write six miles of silly stuff about the autumn breeze.

They speak about the falling leaves, their many tinted hues, about the colors in the clouds—the greys, the greens, the blues. They write a yard about each gust that sweeps across the map, and throw a fit 'bout flowers and frogs that take a winter's nap.

Of course, the poets sell their stuff, they get the ready cash to buy a suit of underwear, some turnips and some hash. But why should we believe their lines, or weep big tearful sobs, because the poet's got to write or be bounced from his job? Ah, let us have the naked truth, begone poetic fire—we yearn for facts in every case—skidoo poetic lyre!

We got 'bout seven tons of coal—we owe most ninety 'bones, which causes us to loosen up a cloud of sighs and groans. We view that pile of diamonds black, we count 'em peck by peck—they'll warm our systems when the snow is campin' on your neck.

The furnace is—you bet she is—a peach for burning coal—she has an appetite immense—she is an ardent soul. We fondly rattle at the works, we whack the pipes for soot, and swear she's ready for the blast, our jolly old galoot. It is with air of calm repose we view the autumn's march, our spirits rise within our smocks as stiff as Monday's starch.

But woe is mine, we shake again, and then in grief we shout: "Ding bust our luck—just look at that—the bottom grate's burned out!"—ARK.

SHEETS are coming in very slowly now owing to the strike. Serious business, too, with cold weather coming on, and all sorts of bedding very scarce.

IT'S powerful hard to get most mechanics to line up to vote for any 65-cent-a-pound-butter farmer candidate.

* * *

WEATHER man is being most powerful kind to one Mr. Coal Bin.

* * *

THANKSGIVING DAY is a great thing. Most people cleaned up the yard, the furnace, the chicken house, the cellar, put on the storm windows, took off the fly doors, painted the strip round the spare room rug and enjoyed themselves generally.

* * *

THIS is an age of production along special lines. New machines are constantly coming on the market. The mechanical papers are your best chance for keeping up to the times.

* * *

WHEN Old John Barleycorn tries to look over your shoulder when you are voting on the 20th, kick the old beggar in the shins. Better still, hit him in the "no's."

Just a Few Sermons

By THE PARSON

While the up-to-date office keeps a checker or inspector to look for mistakes and errors, still it is good policy not to make these errors through mere love of seeing Mr. Inspector kept busy, and gloating over his find.

Some folks claim accuracy is a mere detail. If this is so—see that you keep well up in the detail feature.

Home study is supposed to be only for the highbrows. You will find it pays to be a highbrow—if studying at home means you have joined such an association.

The time clock is a horrible nuisance in some people's opinion. Very well, punch the nuisance—but punch him on time.

When the chief says "Rush"—don't wink your eye at your next pencil-pusher—but give him credit that he may actually be in a hurry for this work—then get it out—in a hurry. It pays.

If being a toady means getting out a little more work than you actually have to, then by all means be a toady.

Your employers may be, in your opinion, a lot of dubs—but, it pays to keep such opinions to yourself. You might be wrong.

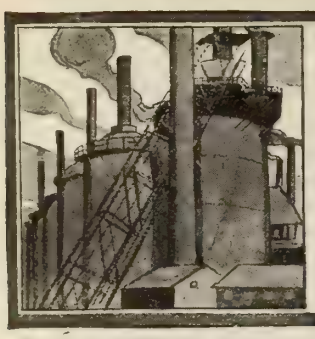
Holidays are all very well—in their place, but—the place is not in the middle of a rush job.

System is something you may have no use for—but—your employers may like to see you interested in such, and you may get to like it in time.

When you are responsible for some error—do not continually pass the buck; stand up like a man and take your medicine.

If you want a raise in salary, deliver the goods and you'll be surprised how soon the raise will come. If it don't, you can always get out to a real company who will appreciate your work. That's one advantage of living in a free country.

Last, but not least, don't get too large an opinion of yourself. You are only laughed at, and besides you don't fool anybody but yourself.



MARKET DEVELOPMENTS

Shipments from Strike Zone Are No Better

Material Much Wanted Not Getting Through on Schedule— Some Concerns That Work From Semi-Finished Are In Poor Way —Machine Tools Sold Well Into 1920

WHILE in a general way, Canadian industry has not been seriously interfered with by the steel strike in United States mills, it is a fact that shipments of much-wanted material are badly delayed, and in some lines are almost "off" altogether. Sheets, tubes and plates, in the order named, are the lines being most affected, and in some cases where firms depend on black sheets for their raw product, things are looking serious.

The machine tool business is coming to be somewhat like the days of the war, when there was such an unprecedented demand for everything in this line. The fact that nearly all the machine tool builders are booked well into 1920 is pretty good evidence that business has been brisk.

There are some real efforts being put forth now to get certain of the Old Country lines on the Canadian market again. Wire rope gives an illustration of this. In prewar days this make of rope had a big sale here, namely, the Scotch output, but it was impossible to send any here during the war. Canadian mills are now turning out a lot of this material, and several United States firms have established a very desirable connection. Unless it be for sentimental reasons in some cases, the Old Country material will have to fight for its re-appearance here.

The steel strike also keeps the scrap metal trade in Canada rather dull. No shipments are being sent out. There is a marked scarcity of stove plate. Agricultural scrap is also in demand and scarce. Prices remain the same.

HARD TO KEEP LIST BECAUSE TOOL PRICES HAVE CHANGED QUICKLY

Special to CANADIAN MACHINERY.

MONTREAL, October 15. — Apart from the passive interest that dealers and manufacturers here are taking in the strike situation in the States, the local conditions have been affected very little by the disturbances that have curtailed the output in the American steel mills. As the days go by the tension becomes less pronounced and normal operations are slowly but surely returning. It would appear that the steel requirements of the past few months, with the probable exception of sheets and plates, has not been sufficient to demand anything like capacity production of the mills, and as many plants have been gradually accumulating surplus stocks, frequently with the object of keeping the men employed, they have been in a fairly good position to stand the temporary inconvenience caused by the men leaving the plants. One local firm, which is a fairly large user of plates and tubes, stated that they had not suffered greatly from the steel strike as their present requirements were comparatively light, and that they were able to obtain all the material they were in need of, although at times the delivery was a little slower than usual. While there is optimism expressed as to the early ending of the strike, no heavy buying demand has developed here, and it is not likely that such will take place this year, but with the improbability of any further labor troubles arising to obstruct industrial enterprise, it will open the way for permanent activity of a reconstructive character. While no price changes have gone into effect here, dealers have been expecting a stronger market to develop in plates and sheets, and also tubes, but the clearing situation in the States has somewhat removed this impression, and the possibilities of advanced quotations are less likely.

Slight Strength in Metals

While the strength of the market is, on the whole, a little improved over the previous week, the demand for metal on the aggregate is about the same. The market here has been affected somewhat by the strike in the States as the production and shipment of metal has been interfered with by the steel men being away from their work. The situation, however, has taken on a better tone, and it is expected that the early market will show a settled tendency. There have been slight advances noted in the local quotation, copper has advanced ½ cent per pound, the prices being 26 cents for lake and 25½ for electro and castings. Spelter shows a rise of ¼ cent over last week's quotation, the current price being 9¾ cents per pound. Other metals have remained unchanged.

Slight Increase in Tool Inquiry

The movement in machine tools shows a slight improvement over the previous week, but as last week was below the normal for this period of the year, the present sales are not considered as any indication that the demand is increasing. There is, however, less delay noted between the inquiry and the sale. This hesitating action has caused considerable inconvenience of late owing to the fluctuating condition of prices and exchange. One firm here who are large distributors of engineering instruments, has not had a fixed price list for four years, as they claim that the changes have often followed each other so rapidly that any quotations would only be misleading. An inquiry some months ago resulted in a recent order coming through at the figure quoted at the time of inquiry. When the customer was advised that the price now would be about 25 per cent. advance on the previous one, it was necessary to give some detailed explanation on the cause of the higher price; and so it goes all along the line. However, all quotations on inquiries, where there is the slightest possibility of any change, are made for immediate delivery,

or subject to revision at the time the order is filled. Early in the year many dealers who had supplies in stock—that had been specially made for shell or fuse work, and which could not be returned to the manufacturers—scratched such materials completely off the books, not figuring of disposing of them unless as scrap. In some cases small jobbers have bought up large quantities of such tools as special taps, reamers, etc., as a speculation. One broker here has on hand some 800 pieces, taps and reamers, that he purchased in bulk for a little over $70, approximately 10c a piece. When new, one of these alone would have cost about $8 or $9. Some use might be found for such tools, but the cost of reconstruction would almost be prohibitive.

DELIVERY DATES ARE FARTHER OFF

TORONTO, October 14.—Canadian shops are doing well, considering that their source of supply is largely interfered with, that is, if they are depending largely on the U. S. mills for steel and iron and all that means. Some of the plants are getting pretty close to the boards, especially those that use a lot of semi-finished material as their raw stock. Shipments are coming forward, to be sure, but there is an increasing time between the date of delivery and order.

The Matter of Delivery

Delivery, as in war days, is coming once more to be one of the great considerations in the machine tool business. There is quite a difference in the policies of several of the houses regarding promises and deliveries. In some of the large shops, where business is done on schedule, the customer is told straight that he cannot expect his machine until February or March, as the case may be. The firm then tries to improve on that delivery as much as possible. In other cases, the idea seems to book the orders and then fight it out about delivery, on the general assumption that every person loves a fight. Some of the best known machine tool makers lose business by this direct way of dealing, but it is very doubtful if they lose in the long run.

There is a good sized volume of business moving in supplies. Dealers seem to be expecting that there will be some arrangement arrived at whereby the giving of special discounts will be done away with. They claim that they are not making money handling many of the lines of taps, dies, reamers, cutters, etc. In fact, one dealer stated to CANADIAN MACHINERY that he knew for a fact that in some cases small shops that would not buy over $100 in small tools in a year were getting as good a figure as his firm, that handled a large volume of business.

POINTS IN WEEK'S MARKETING NOTES

There has been very little change in the strike situation in the U. S. steel mills. Some gains are made in employment, but they are small and hardly affect the output, which is curtailed seriously.

—

Merchant furnaces turning out pig iron in Buffalo and Cleveland are entirely down.

—

Shortage of sheet bars is felt in some of the mills that work from the semi-finished article.

—

Scrap markets in Canada are short of stove plate and agricultural scrap.

—

U. S. mills are hardly booking any business for export.

—

Efforts are being made to get Scotch wire rope on the Canadian market. A lot of American goods come in at present and Canadian mills are also well employed.

—

Mills in the steel business have not advanced prices on account of the strike, but in most cases stock is going out at warehouse prices.

—

Machine-tool salesmen are selling for deliveries well into 1920. Shipment dates seem to have a habit of getting shoved still farther into the future.

The Effect of the Strike

The average warehouse man and machine tool dealer will tell you, "Oh, we are getting along all right," when you ask about the strike conditions and how they are working out on this side of the line.

Plate comes through slowly, and there is quite a time now between the date of order and delivery. One car came to Toronto this morning from Philadelphia, addressed to a local warehouse. It was flooring material, and was actually ahead of the regular schedule maintained by this company.

It can be said, and we believe the experience of purchasing agents who have had occasion to go into the market that will bear this out, that sheets are about the worst hit of any line. There is quite an accumulation of business already. "There is hardly any limit on the tonnage of sheets that could be sold in this country right now if we could get the material," is the way one dealer stated the case to-day.

Black sheets, galvanized sheets, etc., are almost off as far as delivery is concerned. Were this condition to last for any length of time it would hurt stove concerns and kindred lines. Stocks in the country at the present time appear to be low—abnormally so in many cases, so there is very little in the way of reserve from which to draw.

There may have been some shipments of tubes through during the week, but if so they were small and not frequent. It is believed now, though, that shipments will be better. Some shipments of skelp for Canadian pipe mills have come across the border in the last few days, and this is looked upon as a hopeful and significant development.

One warehouse got word a day or so ago that a car of sheets had come over the border to its address, and the firm has been deluged with queries for a part of this stock. It happens to be special automobile stock and much in demand. Prices remain firm. There seems to be no tendency to take advantage of the strike situation to boost the selling prices here, although there are always some cases coming up where a fair premium has been paid for some much-wanted stock.

The Scrap Metal Market

About the only feature in the scrap metal market just now is the shortage of stove plate, although dealers are not yet offering any higher prices for this line. Some of the yards state that there is an acute shortage of plate and very little in sight.

Agricultural scrap iron is also short, and it is in demand just now. There was a great quantity of this and similar irons used during the war, and no accumulations are reported.

The yards on this side of the line are feeling the effects of the strike in United States steel mills, and shipments are interrupted with, and sellers here know there is little use looking to United States buyers as outlets for their stocks. In fact, there is not a very large volume of business moving in any department this week.

Coppers are holding fairly firm, with no change in the prices offered by the dealers.

CANADIAN MACHINERY would again draw the attention of readers to the fact that prices quoted on another page are "Dealers' Buying Prices." That is, one of the largest firms in the Dominion correct the list every Monday, and will pay the prices stated. There may be many deals put through at prices above the list, but for local and particular reasons. It is not possible to publish, as far as we can see, a list of scrap metal prices, showing what the customer will have to pay if he comes into the market. No doubt if firms wanting to secure scrap material would insert a line in the advertising columns stating that they were in the market for certain grades and quantities, or had these to dispose of, they would find a better market than at present, either buying or selling.

U.S. TOOL BUILDERS ARE BOOKED WELL ON INTO THE 1920 BUSINESS

Special to CANADIAN MACHINERY.

NEW YORK, October 16.—Practically all of the leading machine-tool builders have enough business on hand to carry them over the remainder of the year, and some have enough to run them well into 1920. One large Cincinnati concern has orders on its books for five months, and this is not an unusual situation in the machine-tool trade. Buying goes on at a good rate. The bulk of the business is still coming from the Central West, but the East is now holding up its end, and particularly in New England is the demand for machine tools brisk. The largest enquiry now pending covers several hundred tools which the New Departure Mfg. Co., Bristol, Conn., a unit of the General Motors Corporation, will purchase. About $1,000,000 will be expended for new equipment for the New Departure plant, which produces bearings. The Rolls-Royce Co., 27 William Street, New York, has issued an inquiry for about fifty tools for a new plant, which will probably be located somewhere in the East. The General Motors Corporation, which recently acquired the war plant of the International Arms & Fuse Corporation, Bloomfield, N.J., has turned this over to one of its units, the Spalding Chain Co., which will use it for the manufacture of chain. The Duesenberg plant at Elizabeth, N.J., recently acquired by the Willys Corporation, is buying equipment for the manufacture of the new Willys car. It is expected that a large list of equipment will be inquired for in a few weeks as the capacity of the plant will be more than tripled. Other companies which are connected with the automobile industry have been buying, particularly John Thomson Press Co., Long Island City, N.Y., manufacturer of truck axles, whose purchases total about $50,000, and the Hart Roller Bearing Co., East Orange, N.J., which has bought both new and used tools. The Parker Axle & Products Corporation, 19 West 44th Street, New York, has inquired for machine tools for the machining of truck axles.

In New England the companies which have been particularly active include the Gilbert & Barker Mfg. Co., Springfield, Mass., which has purchased a good sized list; the Hemphill Mfg. Co., Providence, R.I., manufacturer of knitting machines, which has bought a quantity of planers and milling machines; the Northway Motor Co., Natick, Mass., which is buying tools for the manufacture of passenger automobiles, and the Lewis-Shepard Co., Boston, manufacturers of elevating trucks, which has bought some new tools.

One of the most active buyers in the New York territory is the E. W. Bliss Co., Brooklyn, which is now inquiring for several very large planers.

There is a falling off in demand for cranes. One inquiry of interest is for thirty-four freight-handling cranes for a new pier and warehouse at Stapleton, Staten Island, N.Y., to be built by the Pan-American Terminal & Dock Corporation, Woolworth Building, New York. American crane builders are reported to have sold cranes for shipment to Canada in successful competition with Canadian builders.

Export trade is not active, but there is a fairly good inquiry from the Far East. Several large tools, costing about $50,000, have been bought here by a Japanese electrical company.

The director of sales of the War Department is offering for sale a large quantity of construction equipment, including steam engines, derricks, generator sets, gas engines, steam boilers and gas pumps, worth about $900,000. Public auctions are to be held all this week at several plants in the Detroit territory and large quantities of machine tools will be offered. The plants include those of the Ford, Briscoe and Harrour motor companies, and the Detroit Shell Co. The absorption of second-hand tools has been quite surprising, and in most instances very good prices have been obtained.

GETTING THE STEEL MILLS GOING AGAIN IS VERY SLOW PIECE OF WORK

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., October 16.—The geographic distribution of the iron and steel strike is the same as a week ago, when this report gave a complete representation, except that there have been slight increases in employment, so that the strike is a trifle less strong than a week ago. It has been losing ground since about the end of the third day, three weeks ago, but it loses ground very slowly. The strike was obviously lost for the men after the experience of the first three days, showing that a large part of the iron and steel industry, more than one-half, as a matter of fact, could operate. Why the strike continues, in such circumstances, is not altogether clearly apparent. One reason, no doubt, is that almost all the real strikers are ignorant foreigners and do not know that the strike is hopeless from the standpoint of winning any concessions, while undoubtedly another reason is that the American Federation of Labor officials are indisposed to make an effort to stop the strike as long as the labor conference at Washington is in session. The calling of the strike just before this labor conference did not help the union cause by any means, but with the strike once started it is better to keep it up than to acknowledge its failure. As to the radicals, who really produced the strike, chiefly Fitzpatrick and Foster, they have no interest in calling off the strike if they see it is lost, as they have nothing to save out of the wreck. The case is different from that of an ordinary strike of a union, when, if the strike is lost, it is to the advantage of the leaders to get the men back to work so that they can be reorganized for further attempts in future. An incidental reason why the strike wanes so slowly is that the manufacturers are not making anything like strenuous efforts to resume. They think haste would result in clashes, probably serious, by men desiring to return to work and those who wish to prolong the strike, and they prefer to let the men get thoroughly tired of striking.

Gains in Employment

There have been further gains in employment in the past week in some regions, but in hardly more than half the entire territory affected more or less by the strike. Thus there has been no gain in the Wheeling district, and indeed the 24-mill tin plate plant at Yorkville, O., went down last Thursday, together with the Southern Ohio plant at Portsmouth, comprising seven open-hearth steel furnaces, two jobbing mills and ten sheet mills. The closing of these two plants represents the only spread of the strike since the first few days, and is, of course, more than balanced by the gains in employment made elsewhere. In Cleveland there has been no gain whatever in employment, Cleveland being down tight, as was the case at the beginning of the strike. In Buffalo there may be a slight amount of employment in plants previously closed tight, but if so the gain amounts to practically nothing. The curious situation remains of the Seneca Iron & Steel Company, a sheet interest, operating comfortably, while the entire Lackawanna Steel Company outfit, immediately adjoining, is closed tightly.

In the Monongahela Valley there have been gains in employment, both as to the Homestead and Edgar Thomson plants of the Carnegie Steel Company and the McKeesport plant of the National Tube Company, which averaged about 75 per cent. operation at the low point, but are now nearer 90 per cent., and also as to plants at the head of the Valley, at Monessen, formerly closed tight and now showing a little operation. In the Shenango Valley there is a slight improvement, whereby that valley is running very nearly full. In the Mahoning Valley, formerly closed tight, there have been slight gains, as the Trumbull Steel Company, at the head of the Valley district, resumed practically in full this week. The men had been brought out the second day of the strike, largely by intimidation. Also, the small nuclei of men that were at work in some large

Youngstown steel plants the first week, and were kept at odd jobs, there being no production, have increased very considerably, so that in the past week or so a little production has been quietly attempted.

The gains in employment and production, however, only change by a few per cent. the condition of the industry as a whole, from the situation obtaining at the end of the first week, the strike being now in its fourth week. Production is probably still well under 60 per cent. of normal, probably about 55 per cent., while employment is but little if any about 60 per cent.

Pig Iron

On the whole the production of merchant pig iron has not been affected as much as the production of pig iron by steel interests, or the production of steel. All the merchant furnaces in Cleveland are down, and most of those in the Buffalo district, but the scattered furnaces are scarcely affected, and the Shenango Valley is running nearly full. The Mahoning Valley is closed practically tight, but it now contains only one blast furnace that is purely a merchant stack. In the Shenango Valley there are nine merchant furnaces, there being six at Sharpsville, two at West Middlesex and one at Sharon. Five of these have been running for ten days or more, one is out for relining, and three have either just resumed or are about to do so.

The demand for sheets before the strike was particularly good and thus it is fortunate that the production of sheets is less affected than that of several other finished products. Last week the American Sheet & Tin Plate Company operated an average of fully 82 per cent. of its sheet mills and is expecting to average better this week, while the independents operated 60 per cent. of the number operated in the week before the strike, though this meant only about 43 per cent. of the number in existence. Future operation will depend not so much upon conditions at the sheet mills as upon the supply of sheet bars, as it does not seem that enough tonnage of sheet bars is being made to carry the sheet mills that are in operation. The sheet mills had some stocks of sheet bars when the strike started.

Hardly any new business is being done in steel products, though some mills are entering occasional orders from regular customers, for delivery at mill convenience. The occasional or chance buyer, who has no regular mill connection, could hardly place any orders with mills, and some of these buyers are looking around for material in stock, on which, of course, they must pay a retail price. The mills are not going to advance prices against any shortage occasioned by the strike. Export inquiry is fairly good, but hardly any of the business offered is being accepted.

The Steel Corporation's unfilled obligations amounted to 6,284,638 tons at the end of September, showing an increase of 175,435 tons during the month, thus comparing with an average increase of 609,000 tons a month in the three months preceding. The increase was equivalent to about 13 per cent. of the month's capacity, while shipments may be estimated at 70 per cent. of capacity, against 81 per cent. in August, and thus the September bookings would seem to be 70 per cent., the shipments, plus 13 per cent., the increase in unfilled tonnage, or 83 per cent. of the month's capacity. Thus, while the Steel Corporation was very reserved throughout September in the matter of selling it did enter a large tonnage.

PIG IRON TRADE

Inquiries for export iron for the Orient have appeared. There is a good demand for spot iron and premiums have been paid for this material. Southern sales are increasing. Following are reports from various U. S. points:

Pittsburgh.—There is a brisk demand for foundry iron, and No. 2 has been quoted at $29 to $31 for prompt delivery. Steel companies have been making good-sized purchases of steel-making grades. About 15,000 tons basic and a smaller quantity Bessemer has been bought, the basic at the full market price.

Boston.—Iron for 1920 of the No. 2X grade has been sold by Eastern Pennsylvania Furnace at $32 furnace. One order of 400 tons and several smaller orders are reported. There is a continually increasing demand for next year iron, but a good many furnaces are still refusing this class of business. Out of 7,000 tons closed during the week, 3,000 tons was for next year.

New York.—A moderate demand with prices firm, covers the market situation here for domestic business. Some furnaces are quoting for next year delivery but most of them are keeping out. For this business $33 eastern furnace is quoted. There is a heavy enquiry for basic and foundry grades from Japanese interests, one enquiry being for 15,000 tons basic. One lot of 5,000 tons was closed but there are no details.

Buffalo.—There is a considerable enquiry, both for domestic and export business, but little business is being done. Furnaces are mostly sold up in this district, and, in addition, there is the strike. No new business for 1920 is being taken.

Cleveland.—There is a pretty steady demand for prompt iron for consumers who are running short on their requirements. Sales on this business has reached very respectable proportions. Plants that have been affected by the strike are asking furnaces to hold up shipments of steel-making iron.

Birmingham.—The lessening of production in the North and West is helping business in the South, and a number of orders for lots of 300 to 1,000 tons have been booked. Furnaces are not taking any 1920 business. Low phosphorus was sold by a Tennessee maker at $38 to $40 furnace.

St. Louis.—Business is mostly in small lots for prompt shipment. Some steel plants are running short of basic, and Southern furnaces will be asked to manufacture basic iron to supply their wants, about 15,000 tons.

U.S. SCRAP METAL

With the exception of the East, where buying by steel works has stiffened the market, conditions are dull. Following are reports from U. S. centres:

Philadelphia.—Buying of around 20,000 tons heavy melting steel by various interests has strengthened the market considerably. This tonnage was sold at from $19 to $20 delivered and quotations now are at the higher figure. All grades are strong with the exception of wrought pipe, for which there is no demand.

Boston.—The market is very dull here, trading being at a standstill. One enquiry developed for a fairly large tonnage from an Eastern steel mill, but nothing was closed. Most people are awaiting events.

Pittsburgh.—The tone of the market is steadier, and some sales of heavy melting have been made at $20 delivered. Foundry grades are in better demand.

New York.—Prices are remaining steady, though business is very dull, new enquiries being almost entirely absent. Deliveries against old contracts furnish all the movement there is.

Buffalo.—Nominal prices and absence of trading is the situation here, mills being mostly out of the market. Some scrap is being shipped against old contracts.

Chicago.—The strike has made the demand for rolling mill scrap and rerolling rails better, and cast scrap is also in good demand by foundries. Prices remain about the same as the last few weeks, with a slight advance in some cases.

Cleveland.—Prices here are easing off some, with yard stocks up, and trading light. Heavy melting steel is quoted at $18 to $18.25, and machine shop turnings $8.25 to $8.50. Prices are expected to stiffen when melters resume operations.

Cincinnati.—Foundries have found it necessary to buy additional scrap to finish their year's business, which has made business better than would have been the case ordinarily. Steel scrap is firmer.

St. Louis.—The market is holding steady, not through any trading, but because dealers refuse to sell except at their own figures, in spite of the fact that they have large stocks on hand. Melters are using up their stocks and will be compelled to come into the market shortly.

Birmingham.—There is no change in quoted prices, and demand for steel and iron scrap is improving.

CONTROVERSY OVER LOCATION OF THE HURON STEEL PLANT AT GODERICH

Things are not going well in connection with the establishment of the proposed Lake Huron Steel Corporation at Goderich. In fact negotiations at present have taken the form of an abusive campaign by B. H. McCreath against E. R. Wigle, mayor of Goderich, because the latter cannot see his way clear to go ahead and favor the annexation of a large block of property to the town.

In a recent issue of the Goderich "Signal" there appeared an open letter from Mr. McCreath to the mayor of Goderich. It sets forth Mr. McCreath's side of the trouble as follows:

"There has come to my notice through the press and otherwise, the remarks which were made by yourself and certain other members of the council in connection with the proposed annexation of the land to the south of the town. Let me say frankly, such pessimistic piffle is what has been the trouble with this community for many years.

"The by-law which you were asked to vote upon was merely to show your good faith. On condition that the company would guarantee—and that guarantee had to be acceptable to the town—that they would spend here $2,000,000 during the next eighteen months, the town would agree to annex the land to the south of the town and give freedom from taxation on the industrial area. Surely no fairer offer was ever made to any community.

The reason for your stand on the matter is not clear, for, since the very inception of the proposition, you have never given it the support it should have received, and in fact your attitude has been worse than if you had been an out-and-out opponent of the scheme. When one is in the vicinity of a mule it is not necessary to wait until he kicks; his ears are sufficient warning for most people.

"Let me make a resume of the course that you have taken during the past few months:

"You were one of those who stood sponsor for the delegation which went to Ottawa, yet you very carefully sidestepped the trip yourself and later acknowledged to me that you had no desire to go.

"Not once, but many times during the summer when we were endeavoring to close up the options on the property, different owners questioned me as to why you took the attitude of knocking the whole proposition. No doubt you will now say that this did not happen, but, as stated above, your every action has been one of opposition.

"Two days before certain directors of the company arrived here, I asked you to meet them and discuss certain phases of the situation. What was your answer? 'I have many things to do this week and do not think I can find time to see them.' And these men where here representing a company that, if located here, would make Goderich a city in two years.

"I might have overlooked your attitude in the first few weeks when these negotiations were in progress, if you had taken any steps at a later date to give the citizens of the town any leadership in finding out the standing of the men behind the company. Mr. Warren and myself went to your office and gave you a list of the directors and the names of two additional men not made public, and asked you to investigate their financial and business standing. Three weeks went by and you can imagine my amazement when, two days before your council was to consider the by-law, you told me in your office that you had not a single line with reference to any man in the company.

"You were really a manager of a huge stock company of some 5,000 shareholders. When a proposition such as this was placed before you, it was your duty to immediately make every effort to ascertain the standing of the men behind the company so that you would be able to give some leadership to the community. Rather than that you took the opposite course and took no personal action in investigating any member of the company and at the end of three weeks had absolutely no information as to any one of them. Had you been alive to your duties you would have personally visited Detroit, Cleveland and Newark to have a personal conference with the men mentioned and to get a line on their financial stability.

You chose the other course, and from reports in the press you apparently adopted your usual method of sneering criticism and a desire not to meet facts but to throw in our path every possible obstacle.

"This community has been offered, without obligation, the biggest industry any Ontario town has ever had the privilege of negotiating with. When the formal meeting is held next week and the names of the officers are made public, you will perhaps be the first to realize the position in which you have been placed. Your proper course then will be to tender your resignation for the miserable failure you have made of a big opportunity.

"The very night that you were asking, 'What is the financial standing of the company?' representatives of one of the largest Canadian banks were in Detroit negotiating for the underwriting of $4,000,000 of the preferred stock of the company. That bank had no more information as to our plans than had you; the very difference in the action of yourself and the managers of that bank is indicative of the size and mental calibre of those concerned.

"If, for any reason this company locates in this district, but not at Goderich, the cause can be laid to the door of a pessimistic community, lacking leadership at the most critical time in its municipal career.

"Yours for a Greater Goderich,
"B. H. McCREATH."

The Feeling in Goderich

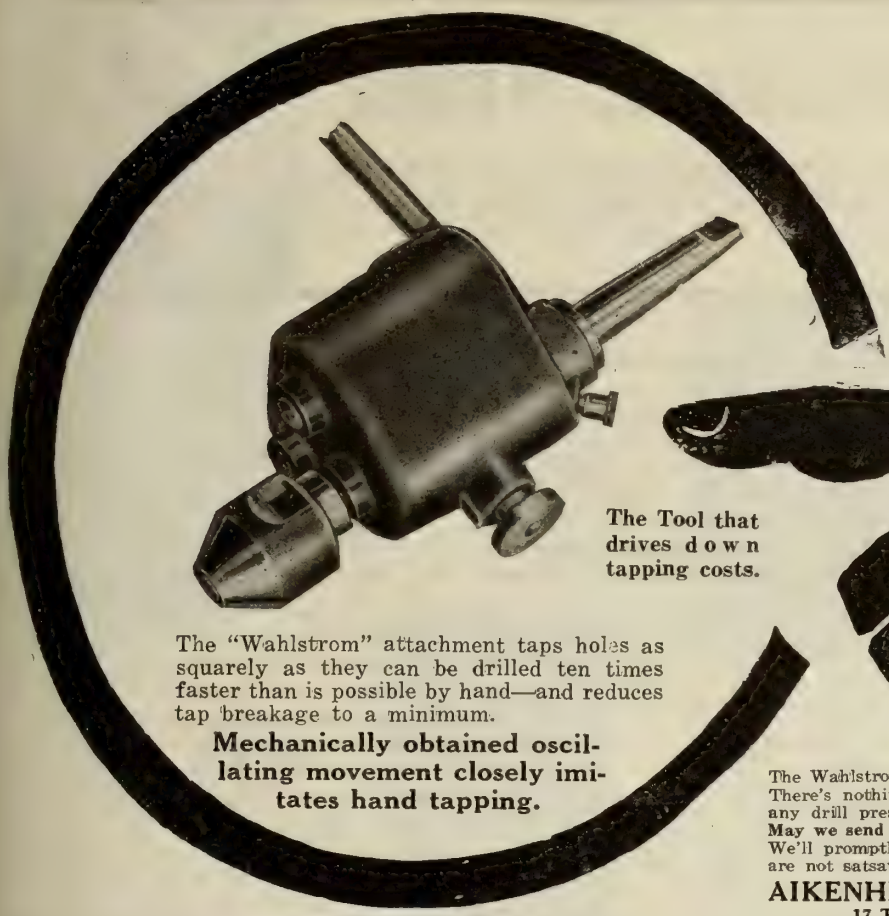
According to the Goderich "Signal," public opinion is with, rather than against Mayor Wigle. An editorial expression of opinion, in the same issue of the "Signal," has the following:

"It is exceedingly unfortunate that the negotiations between the town council and the Steel Corporation as represented by Mr. McCreath have reached a condition of deadlock. Mr. McCreath appears to lay the responsibility upon Mayor Wigle, but if the "Signal" is any judge of public opinion, from seventy-five to ninety per cent. of the people of the town share the Mayor's views, or at any rate are in serious doubt as to the safety of the course upon which the municipality is invited to enter. It would be better, we believe, to delay the submitting of the by-law to the people than to risk its defeat, and in the meantime the proper steps might be taken to remove the unfavorable impression that has gained such headway among the citizens. Frankly, the trouble is that the land-holding company comes in between the council and the steel concern and prevents the "get together" that is desirable. If this difficulty could be removed there should be no further trouble, as the town wants the steel plant and is willing to make any reasonable concession to secure it. Surely there is some way of arriving at a fair agreement, if all parties show a candid and reasonable spirit."— Editor "Signal."

As CANADIAN MACHINERY understands the case, the mayor objected to Mr. McCreath, the promoter of the Land Co., and the Land Co. in turn promoting the Steel Co., wanting the town to annex 1,008 acres to the town. The mayor's claim is that there is now enough land inside the town limits for a population of from 25 to 30 thousand people. Another feature is that the mayor and others were not sure of securing the Steel Co., and found it difficult to separate the Land Co. from the Steel Co. in the negotiations that had been carried on.

A. G. Gibbons, formerly superintendent of tools and supplies of Winslow Bros., Co., Chicago, which company had a contract for a million shells for the Government, has affiliated with the Wetmore Reamer Co., Milwaukee, in the capacity of production engineer. Mr. Gibbons was also formerly with the Cadillac Company and Brown & Sharpe for many years. The Wetmore plant has been rearranged and additional equipment installed under Mr. Gibbons' direction, and the weekly production of Wetmore expanding reamers considerably increased.

Chemical Plant Operates.—Production of soda ash is now being carried on in three shifts at the plant of Brunner Mond Canada, Ltd., at Amherstburg, after several months' idleness.



Aikenhead's Wahlstrom Attachment

The Tool that drives down tapping costs.

The "Wahlstrom" attachment taps holes as squarely as they can be drilled ten times faster than is possible by hand—and reduces tap breakage to a minimum.

Mechanically obtained oscillating movement closely imitates hand tapping.

The Wahlstrom is **built for long service.** There's nothing to get out of order. Fits any drill press. Makes taps of all sizes up to ½-inch.
May we send one on trial?
We'll promptly refund your money without question, if you are not satsatisfied.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

Getting New Plant.—The Acme Roofing Co., Walkerville, Ont., have sold their factory, and it is their intention to erect a new plant and install the most up-to-date roofing machinery and equipment. They are now receiving tenders on new machinery. Information as to the location of the new factory will be given out later.

Portable Plant.—The Electric Welding Company, 178 Bleury St., Montreal, which has been in business since the beginning of June, has now in service a portable plant mounted on a 2-ton truck that can be taken to any point for immediate repair work. The plant consists of a 30 h.p. Matthews gasoline engine, connected to a 250 ampere Lincoln generator. H. H. Getz and F. Alcott, both experienced men, are associated with the company.

In Barton Tp.—Firestone Rubber Co. will probably locate in Barton Township, just outside the eastern limits of Hamilton. A large tract of land has been secured, part for industrial purposes, and the balance for employees' homes. The Barton Township ratepayers are voting on a tax exemption proposition. In the meantime the Firestone Co. have leased the old Canadian Cartridge plant, Hamilton, and will start building the machinery there for the new rubber plant. Mr. Cook, formerly superintendent of Canadian Cartridge Co., is to have charge of the machine building.

Canadian Patents.—The following is a list of Canadian patents recently issued through the agency of Messrs. Ridout & Maybee, 156 Yonge Street, Toronto, from whom further particulars may be obtained: Ewart McLaughlin, sockets for automobile curtain rods; Charles Taylor, dinner carry-alls; Gutta Percha & Rubber, Ltd., process for forming rubber fabrics; Henry P. Fletcher, means for the conversion of water pastes into oil pastes by chemical and mechanical action; Thos. W. S. Hutchins, the manufacture of lamp black; Jabez Muskett, hose couplings and hose attaching devices; Diaphone Signal Co., Ltd., metal bending and forming machine; Nils Testrup, methods of conducting high temperature reactions; John Forsyth, Ltd., reversible cuffs; E. O. Williams, slipways for the construction of reinforced concrete ships, barges, floating structures and the like.

Less Space Requisitioned.—The British Shipping Controller has announced that in the future the space controlled by him on steamers to Canada will be reduced. It is at present 50 per cent., but it will be eased off monthly until all space is free for private shipments.

Granby Starts By-Product Plant.—The Granby Consolidated Mining Company at Anyox, B.C., have now put their by-product plant in full operation. Toluol, benzol, sulphate of ammonia, and coal tar are among them. The coal tar will be shipped to Vancouver and resolved into pitch and creosote, and will be sufficient for all B. C. requirements in these lines.

Secure Power Supply.—The International Paper Company has just recently entered into contract with the Shawinigan Power Company to supply all the power requirements for the large new development at Three Rivers, Quebec. It was first thought that the Paper Company would undertake the exploitation of power generation on their own initiative, but after a thorough survey of the power situation, it was decided that it would be more successful and economical to purchase their power from outside sources. The ultimate horse power that will be required is problematical, as this will be augmented from time to time as the needs become greater. The initial output of the mill will be about 200 tons of newsprint per day, and this will call for about 20,000 h.p. The plant, when in operation, will employ about 1,500 men.

St. John, N.B.—Angus McLean, general manager of the Bathurst Lumber Co., and Major V. J. Hughes, of Montreal, manager of the Canada Iron Corporation, appeared before a meeting of the Provincial Government this week in connection with the plans for the development of water power on the Nipisquit River. The contract, Mr. McLean said, is to be carried out by Morrow & Beatty of Peterborough, Ont., under direction of Wm. Kennedy, Jr., hydraulic engineer. It is proposed to build a dam at Grand Falls on this river to develop 10,000 horse power, to be transmitted to Bathurst, N.B., for the operation of the pulp and saw mills and other industries controlled by the Bathurst Lumber Co. Two generators will be installed at once and arrangements made for the installation of a third, if necessary. The transmission line will carry from 50,000 to 55,000 volts and will be erected on steel poles.

W. T. Hamilton has applied to the city council of Fredericton in behalf of the Plumbers' Exact Supplies, Ltd., for a site in Argyle street with certain tax exemptions, to erect plant to employ from fifteen to forty men.

Provincial capital is now being interested in the development of the antimony mines at Lake George, N.B., and plans being completed for the new project which includes manufacturing the by-products of the mines in New Brunswick. Plans call for an investment of about $150,000 in connection with the plant and for the duplication at St. John, N.B., of a plant now in New York. W. H. Irvine, of Fredericton, N.B., is interested in the scheme and is receiving encouragement. With the new Valley Railway having started extra transportation facilities are afforded.

TENDERS

The erection of the new dry dock at Esquimalt by the Provincial Government has been decided on. Tenders will be called for very shortly for the construction work.

Improvements of the harbor at Glace Bay, N.S., will be undertaken by the Dominion Government in the near future. This includes dredging of channels, etc., and will cost approximately $50,000.

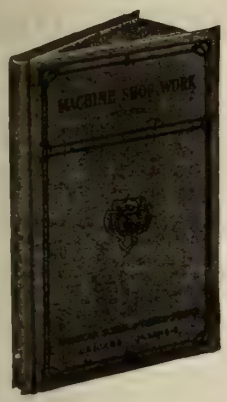
The Department of Public Works is calling for tenders to be in by October 21 for renewing the floor of Shellmouth Bridge, Shellmouth, Man. Plans and specifications can be obtained at the Department, Ottawa; office of the District Engineer, Winnipeg, Man., and at the post office, Shellmouth, Man.

Department of Railways and Canals are calling for tenders to be in by October 20 for reconstruction of the east pier at Port Maitland, Ont. Plans and specifications can be obtained at the Department, Ottawa, or the office of the superintending engineer, St. Catharines, Ont.

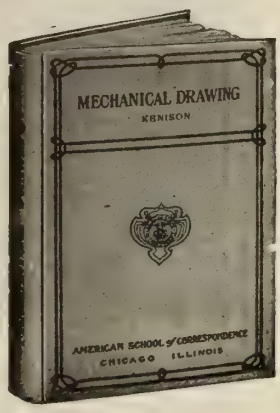
The Department of Public Works of Ontario is asking for tenders, which must be received by October 17, for the excavation of foundations and building foundation walls of the new main building at the Ontario School for the Deaf, Belleville. Plans and specifications can be obtained from the bursar of the school or from the Department.

Mechanical Engineering Books

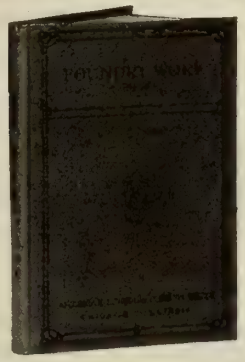
If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.



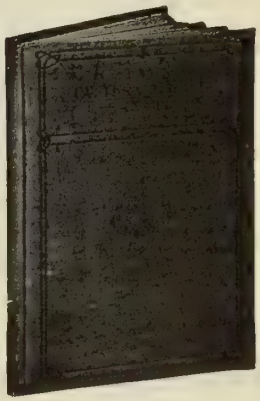
MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price $2.00



MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.25



FOUNDRY WORK. Revised by Burton L. Gray, instructor in Foundry Practice, Worcester Polytechnic Institute. 224 pp., 191 illus. Cloth binding. A practical handbook on standard foundry practice, including hand and machine molding, cast iron, malleable iron, steel and brass casting, foundry management, etc. Includes use of various types of molding machines. Price, $1.25



PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price.....$1.75

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price ... $1.75

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.25

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers. Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tapholders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.75

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

The Department of Public Works, Ottawa, require tenders for grain conveyor equipment for St.. John Harbor, N.B., which will be received up to October 23.. The equipment is for Berth 15, and plans and forms of contracts can be obtained from the office of the Engineer-in-Charge, St. John, N.B., or from the District Engineer, Shaughnessy Building, Quebec, Que., and Equity Building, Toronto, Ont.

INCORPORATIONS

Ottawa Civic Hospital.—The plans for the proposed civic hospital, which is to cost $1,400,000, will be drawn up by Messrs. Stevens & Lee, of Toronto and Boston. This firm specialize in hospital architecture. The architects' fees will be 7 per cent. of the cost, paid in instalments as the work progresses.

Rushing Work on New Plant.—The contractors for the new plant of Porritts & Spencer, at Hamilton have been promised a substantial bonus if they complete the buildings ready for the installation of machinery by December 1. President Spencer is on his way from England to Canada, and is very anxious for the company to get into its Canadian headquarters.

To Start January 1.—The plant at Brantford of the Robbins & Myers Company will be ready for operation on January 1, 1920, according to a statement by Mr. R. B. Booth, general manager of the company, who has arrived in the city. One large building, 150 by 360 feet, is all that is contemplated at present, and H. K. Ferguson, of Cleveland, has the contract for that. The only possibility of a delay will be in case of a hold up of the structural steel. The brick supply has been assured.

Ottawa.—Incorporation of the following companies is announced in the "Canada Gazette": Dominion Oilcloth & Linoleum, Ltd., Montreal, $5,000,000; Whitehead, Winans, Ltd., Montreal, $50,000; Ames-Holden Felt Company, Ltd., Montreal, $500,000; Associated British Industries (of Canada), Ltd., $100,000; Levant-American Mercantile Co., Ltd., $25,000; General Iron & Metal Co., Ltd., $19,000; Emile Lacas, Ltd., $500,000; Edmonton Lumber Exchange, Ltd., $200,000; Pacific Metals Transportation Co., Ltd., Montreal, $15,000; Rock City Tobacco Co., Ltd., Quebec, $2,500,000; Canadian Consolidated Corporation, Ltd., Toronto, $110,000; Salem Oil & Grease Co., of Canada, Ltd., $45,000; Canadian Steel Tire & Wheel Co., Ltd., $1,000,000; James Robinson Co., Ltd., $600,000; French Clasp Co., Ltd., Montreal, $50,000; Chemical Products Corporation, Ltd., Toronto, $3,000,000; Dominion Stores, Ltd., Toronto, $575,000; The Colonial Glass Co., Ltd., Lakefield, Ont., $50,000; Rideau Iron & Metal Co., Ltd., $25,000; Edwin E. Bell, Ltd., Hamilton, $50,000; Canada Brass Products, Ltd., Montreal, $50,000; The Automobile Exchange of Canada, Ltd., Montreal, $100,000; Blackburn's, Ltd., Toronto, $40,000; Canada Bitulithic, Ltd., $1,500,000.

Montreal.—The visit of David Rogers, the general works manager of the Skinner-Eddy Shipbuilding Corporation, Seattle, has given rise to some interesting rumors relative to the forming of a great shipbuilding syndicate. According to these tales, several prominent shipbuilders in the States and Canada would amalgamate and lay down yards in the most suitable locations, notably Montreal. Work to the amount of $400,000,000 is said to be already pledged. Old Country builders would be included in the merger.

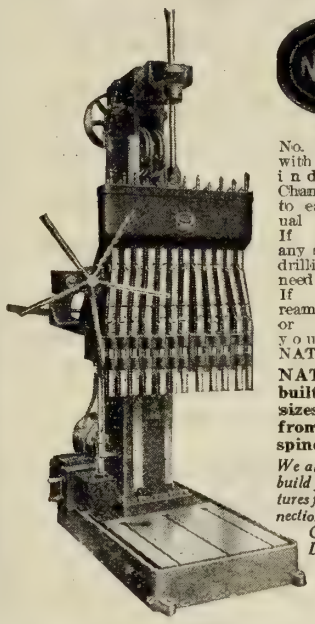
Belleville.—Bound from Belleville to Oswego, the schooner Grace M. Filer was dismantled in a squall in the Bay of Quinte recently. The mizzenmast went by the board, the main topmast carried away, and several of the head sails. The skipper was standing near the rail, about three feet from where the mizzenmast struck in its fall, and had a narrow escape of being killed. The vessel will be laid up after being repaired.

Brockville.—The steamer Richard W, bound for Ogdensburg, went ashore in Lake St. Louis. Tugs from Montreal endeavored to refloat her without success, and the Donnelly Wrecking Fleet from Kingston was appealed to. The vessel will be taken to Ogdensburg for dry docking after being refloated.

Brockville.—The steamer Keynor, belonging to the Montreal Light, Heat & Power Company, went ashore at Annasette Light, Lake St. Francis, while on a voyage to Montreal. She is expected to float shortly. The steamer Adrian Iselin, which had an accident in the Cornwall Canal a few days ago, has been hauled out at the Ogdensburg Shipyard for repairs.

Sacketts Harbor.—The Donnelly Salvage Company, which is engaged in salvaging the cargo of the barge Hilda, wrecked on Stony Point, is making good progress. So far about 5,000 bushels have been removed from the wreck. The Hilda is exposed to the full sweep of the lake with a south-west wind, and this makes salvage operations difficult. She is lying head on to the shore, and is in about 9½ feet forward and 10 feet inches aft. Capt. Donnelly has no doubt that he can get her off after lightening.

Negotiations are now pending between Lewis J. Seidensticker, manager of the plant of the Atlantic Sugar Refineries here, and their employees regarding increased wages and shorter hours. The manager went to Montreal this week to confer with headquarters regarding the matter.



NATCO

No. 41 NATCO with patented independent Change of Speed to each individual Drill.
If you have any straight line drilling you need a NATCO.
If you tap, ream, spotface or counterbore you need a NATCO.

NATCOS are built in 11 sizes ranging from 2 to 72 spindles.

We also design and build jigs and fixtures for use in connection with NATCO Multi-Drillers

Welding and Cutting Apparatus

Canadian Rights for Sale Covering Well-Known and Profitable Oxy-Acetylene and Oxy-Hydrogen Welding and Cutting Equipment.

An excellent opportunity is offered to established brass manufacturing shop or a small manufacturing company to be organized to produce in Canada complete line of welding and cutting apparatus.

This equipment was placed on the United States market early in 1918, is fully protected by United States patents, and Canadian patents have been applied for within the required time.

Already being sold in Canada to an extent which will insure success of Canadian manufacturing company. Can be handled either direct or through jobbers. Net profits very large.

Patents, complete blue prints and specifications of entire line, as well as initial services of designer and inventor, may be obtained at a reasonable figure.

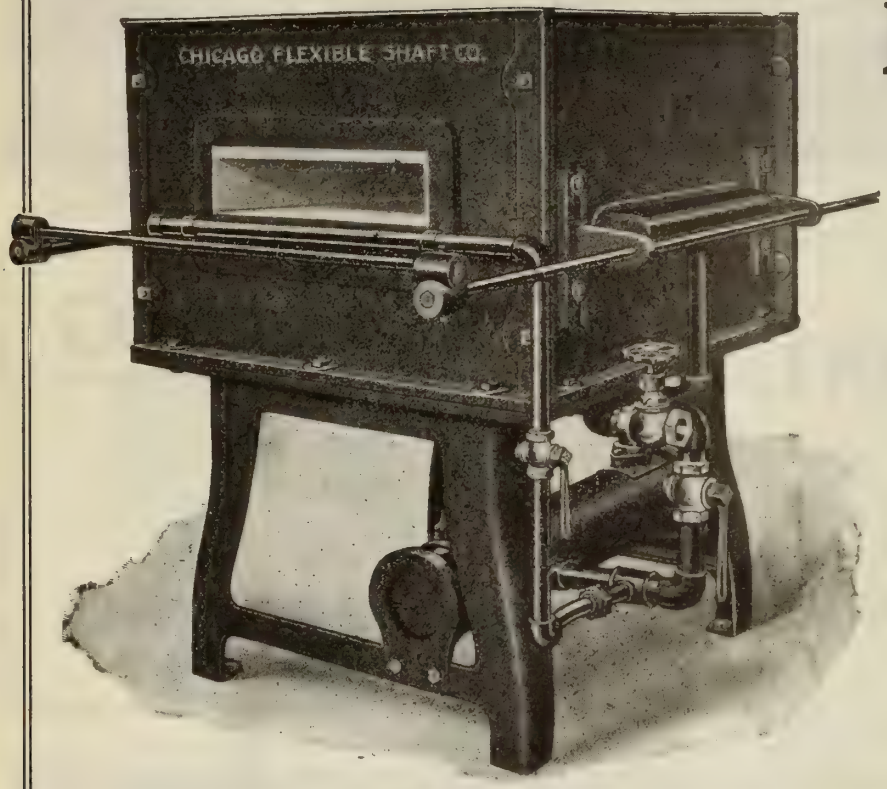
Stewart Equipment Is Always Dependable



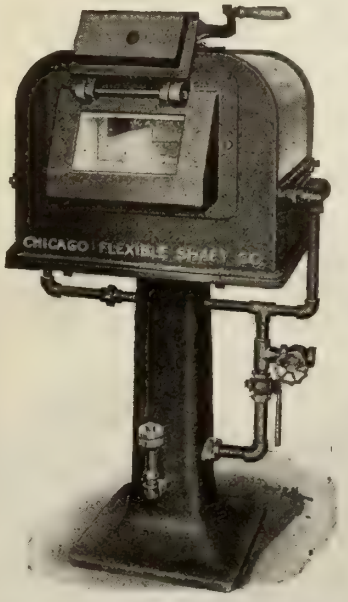
Drop Hammer Forge
(Eight regular sizes.)

THE biggest requirement of any furnace or forge is that it be ABSOLUTELY DEPENDABLE and able to stand up day after day, month after month, under exacting conditions.

Stewart Furnaces and Forges for heat treatment of metals are just that kind. They are scientifically built; they guarantee uniformity of product; they maintain that uniformity under most unusual tests.

Stewart equipment is built to give service. Our furnaces and forges are sold on a money back, thirty-day trial offer, and you are the one to be satisfied that they do all we claim.

Stewart Furnaces and Forges save time, save fuel, save material—and save the furnace man's peace of mind.



No. 1 Oven Furnace.
(Many types and sizes of oven furnaces covering many heat treating requirements.)

More than 30,000 in use in 10,000 plants in Canada and the United States is evidence of their popularity and satisfactory service.

There is Stewart equipment for every heat treating requirement. Over a hundred different sizes and types are shown in our catalogue. It's yours for the asking.

Try it Yourself

The best argument in favor of throwing away files the moment they become dull is to try filing a job yourself with a dull file.

If it makes you irritable, think what effect it must have on a man who has to file all day long.

Don't let your men work with dull files. Tell them to turn them in when they become dull.

When buying, specify Famous Five Files. You get a good run of sharp service from them because each file is accurately cut, well balanced and properly hardened.

Thor Chipping, Calking and Beading Hammer

Thor punch has helped put across many a job

Time is one of the most important items involved in every contract job.

The speed with Thor Hammers, Drills and other Tools work has pulled many a contract through on time.

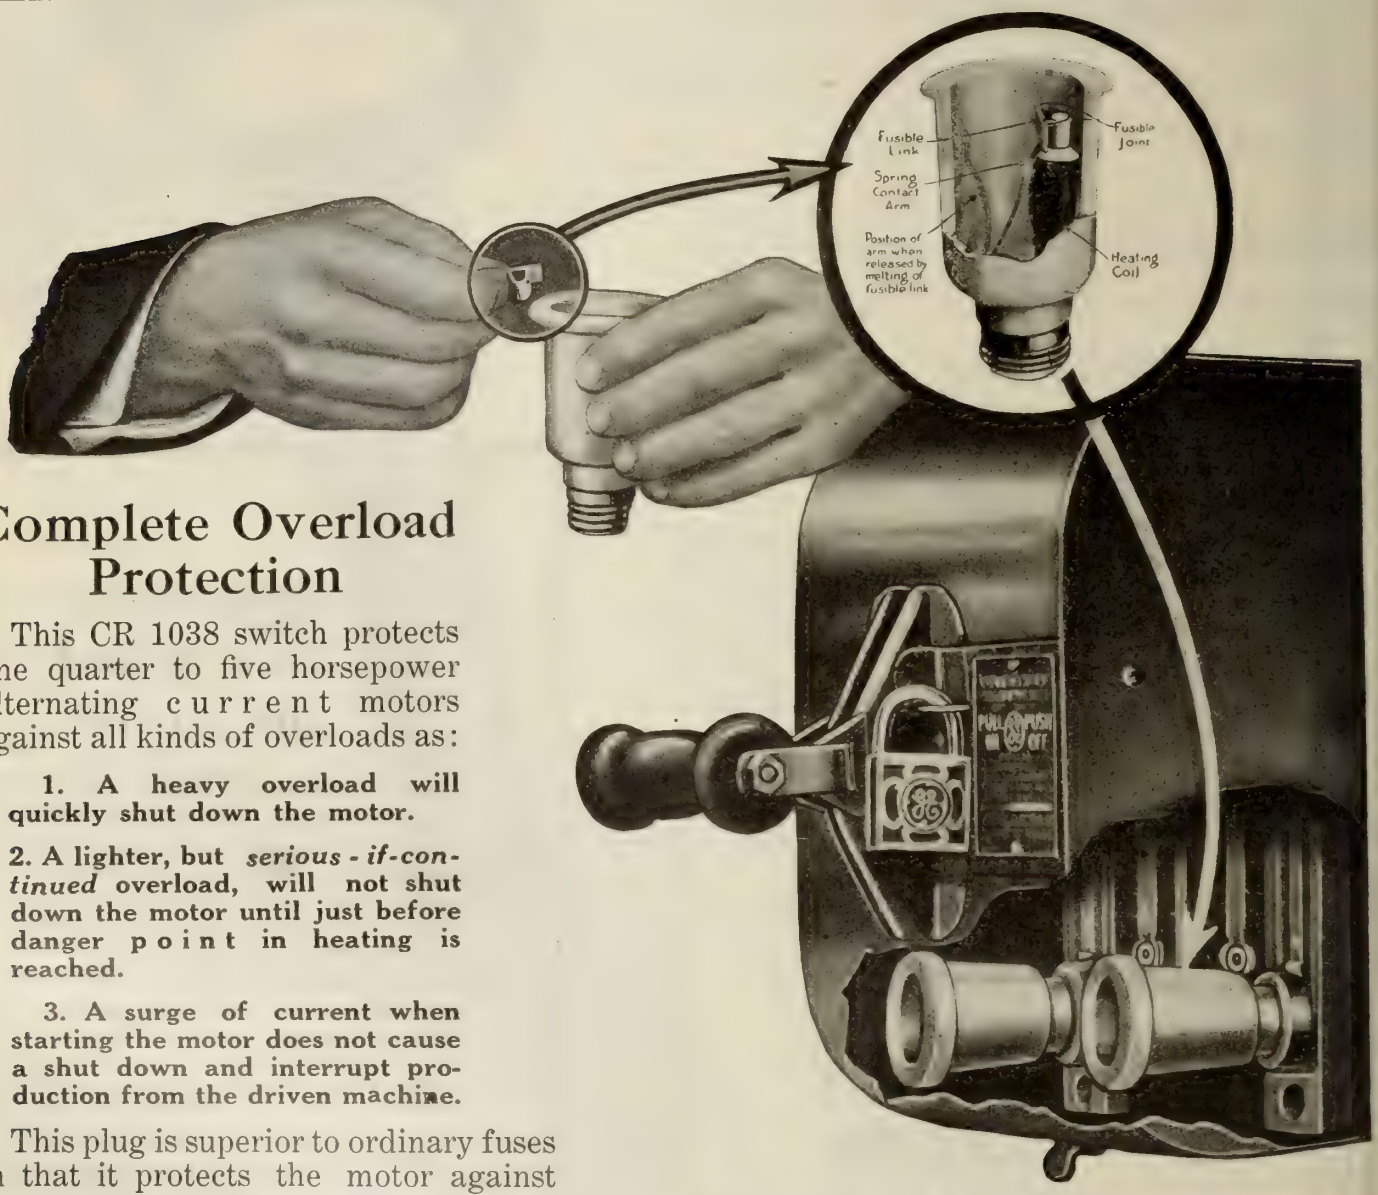
Thor

Important motor driven productive machinery must be kept going. Interruptions are practically eliminated where motors are automatically protected against only the overloads that injure.



Complete Overload Protection

This CR 1038 switch protects one quarter to five horsepower alternating current motors against all kinds of overloads as:

1. A heavy overload will quickly shut down the motor.

2. A lighter, but *serious - if-continued* overload, will not shut down the motor until just before danger point in heating is reached.

3. A surge of current when starting the motor does not cause a shut down and interrupt production from the driven machine.

This plug is superior to ordinary fuses in that it protects the motor against overloads, which are serious because continued, while the former protected only against peak overloads.

Ask our nearest office for descriptive sheet No. 68327A

A small spring switch in the poreclain protective plug shown is held shut by slipping a little link over its end. If a current large enough to injure the motor flows through the plug the fusible joint of the link is melted by the heating coil. For the cost of a postage stamp the link can be renewed and plug made operative again.

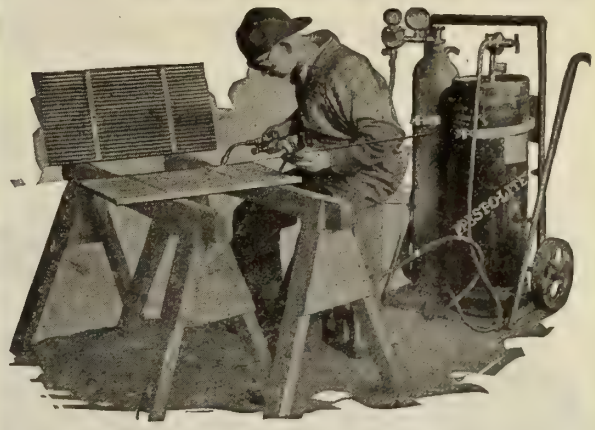
Oxy-Acetylene Welding and Cutting



Prest-O-Lite Welding Has Proved Its Value

In nearly every line of metal manufacture, from the making of delicate jewelry to massive locomotives, the Prest-O-Lite Process of Oxy-Acetylene Welding has firmly established itself. Where two pieces of metal are to be joined, it is supplanting the bolt, rivet and threaded joint in hundreds of factories and repair shops.

The above illustration shows a Prest-O-Lite operator reinforcing corrugated iron sheets, saving the time and expense of boring and rivetting, simplifying the work, and producing a neater, stronger job.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe automatic regulators and gauges and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

When You Lift the Cat—

Do you carry her near the ground so that her claws catch in the carpet, or do you lift her clear?

—When material is moved from place to place in your factory or warehouse, is it lifted clear of the ground—as you would lift a cat—or is it carried in Trucks?

Every obstruction on the ground, every uneven patch in the floor, all the other traffic in passage ways blocks a truck. It is impossible to carry much of a load at a time. A piled-up truck is hard to steer and manage. There is every chance for a truck to collide with corners, machinery or other trucks—resulting in lost time.

How small castings can be carried overhead.

BT Overhead Conveyors

With BT Overhead Conveyors, material is moved quickly and with a minimum of handling. The obstructions on the ground do not matter. For running between buildings or out into the yards, they are ideal. The cost is trifling compared to the money they save. Our experience in designing conveyors for different industries is at your disposal. We have equipped steel plants, coal sheds, ice houses, leather tanneries, lime kilns, brick yards, pickle factories and a number of others. Our conveyors can be installed in any building.

An opportunity to give you further particulars would be greatly appreciated. An expression of your interest will bring full details. Your written request for further information will place you under no obligation whatever.

How a fruit company uses a BT overhead conveyer to unload freight cars.

Here's Real Economy

This patented Hurlbut, Rogers Cutting-Off and Centering Machine embodies two cutting-off tools—one cutting up and the other cutting down; each holding the work against the other. What is the result?—**the production is doubled and the cost is cut in half.** Further, the centering operation goes on at the same time. Doesn't this appeal to you as real economy in production? When you are assured of such good-paying results why hesitate to adopt this machine? Soon pays for itself.

Hurlbut, Rogers Cutting-off and Centering Machine

All-steel Material Cabinets reduce overhead

WE make a complete range of these time and money-saving cabinets to meet every requirement.

Ideal for storing material, tools, stationery, records, valuable stock, etc.

Marketed for years throughout Canada under our trade-name

DENNISTEEL
Made in Canada

Our steel cabinets protect contents from fire and thieves. The adjustable shelving makes it possible to keep stock exactly as desired, saving time in seeking the article wanted and in stock-taking.

Rats and mice cannot gain access as with wooden cabinets. Additional units of identical specifications may be added as required.

Let our engineering department devise an installation for your special needs. We make steel shelving, steel wardrobe lockers, steel safes, etc. **Illustrated folders gladly mailed.**

The Canadian Disc Sander is 90% Dustless

Think what a godsend that is to the pattern shop! Hundreds of prominent concerns are profiting immensely by using these sanders.

Two types of Canadian sanders are built—the Disc Sander and the Oscillating Spindle Sander. Both machines are equipped with New Departure ball bearings and General Electric motor. The table in each case can be tilted by a hand adjustment, 45 degrees down or 15 degrees up. Power is obtained by plugging into a lamp socket. Canadian Sanders are extraordinarily well built and are guaranteed against all defects.

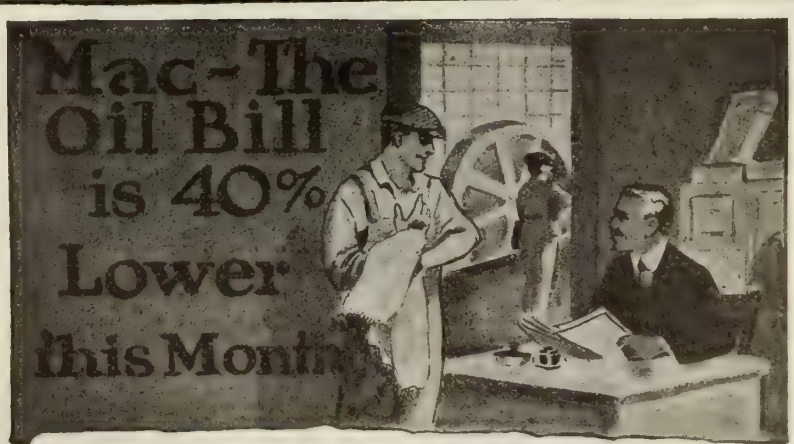
STEEL CASTINGS

Mild Steel, High Carbon Steel, Manganese Steel, Chrome Steel

We are manufacturers of Steel Castings running from ½ lb. to 5000 lbs. each and are in good position to furnish prompt deliveries at moderate prices. Try us with your next order.

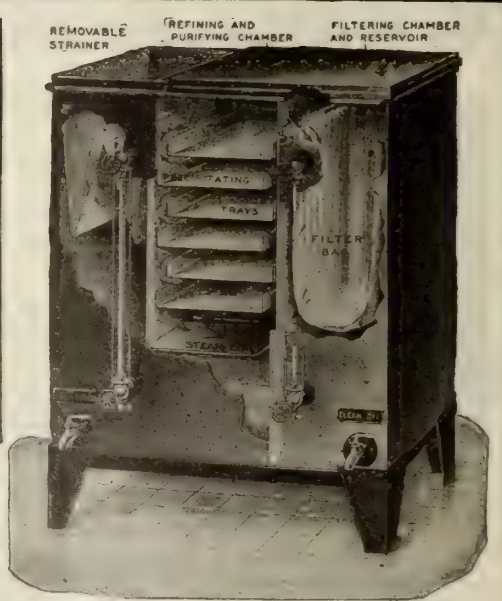
The William Kennedy & Sons, Limited, Owen Sound

ESTABLISHED 1860



"Yes, sir, and there's a good reason for it too. Since we installed the BOWSER Oil Filtering Outfit the men in the engine room have been competing to see who could save the most oil. They've cleaned the journal boxes, put pans under them to catch the drips and then put the salvage through the BOWSER Oil Filtering Outfit. We are now using the oil over and over again that was formerly wasted."

The BOWSER Oil Filtering Outfit is simple, compact, economical and reliable.



Bowser 7F Oil Filter

First, means a cleaner engine room.

Second, it cuts your lubricating oil bill considerably.

Third, IT PAYS FOR ITSELF over and over.

WRITE FOR LITERATURE DESCRIBING OIL FILTERING SYSTEMS SUITABLE FOR YOUR POWER PLANT.

Is the Alien a Menace?

IN the October issue of MACLEAN'S MAGAZINE a strong presentation is made of the reason why the people of the West are against further foreign immigration.

"The Menace of the Alien" depicts the foreign problem in the Canadian West as it exists to-day, and shows every one of us why we must Canadianize our Ruthenians, Austrians, Slovaks, and our fifty-seven other varieties before we allow any further "unrestricted" immigration.

This article is written by a member of MACLEAN'S MAGAZINE staff who has just returned from a careful, personal investigation of the situation. Shall we have a "White West?" Many Westerners are demanding it. Are the aliens to swing labor into the bosom of the O.B.U.? It is being done—and what must we do to stop it?

The "inside" story of the routing of the Drumheller miner aliens by returned Canadian war veterans is here told by MACLEAN'S for the first time. What leadership must be substituted for the O.B.U. leadership of these foreigners?

The October issue of MACLEAN'S is a Western number in the sense that it contains many articles and stories of distinctly Western interest. For instance:

X "Those Pesky Farmers Out West"

By Hopkins Moorhouse, Author of "Deep Furrows"

They have completely upset the old order of things. No longer will politics consist of the comfortable fight between the Ins and Outs with the old party lines maintained. The grain growers on the Prairies have upset the calculations of the professional politicians and completely changed the face of Dominion politics.

X "Fifty Years in the West"

By Professor W. T. Allison

A breezy and readable sketch of the business career of Winnipeg's veteran business man, James H. Ashdown.

"Further Discoveries of New Land"

By Vilhjalmur Stefansson

The final and most interesting instalment of Mr. Stefansson's story of his wonderful trip of five years' duration in the Canadian north in which he tells for the first time of finding new continents in the Arctic and hoisting there the Canadian flag.

X "The Banshee Bell"

By Edith G. Bayne

A bright love story laid in the mountains of British Columbia.

Other Splendid Features of October MacLean's

X "The Turmoil at Ottawa"

By J. K. Munro

A comprehensive survey of Dominion politics, written with complete impartiality and absolute candor. It is bright and breezy, with a knock in every line for the politicial opportunists. It plucks many tail feathers from our party leaders.

"Spanish Doubloons"

By Camilla Kenyon

The start of a bright and fascinating serial story by a brilliant young writer. It is the Spanish Main brought up-to-date, treasure hunting with a background of fun and romance.

"The Airy Prince"

By Arthur Beverley Baxter

A complete novelette in which is presented a bird's-eye view of England in time of war. It is one of the most brilliant stories that has been written of recent years.

"His Majesty's Well-Beloved"

By Baroness Orczy

The latest novel by this popular authoress appearing exclusively in MACLEAN'S.

"Ebb and Flow"

By C. W. Stephens

A strong business story laid in the province of Quebec.

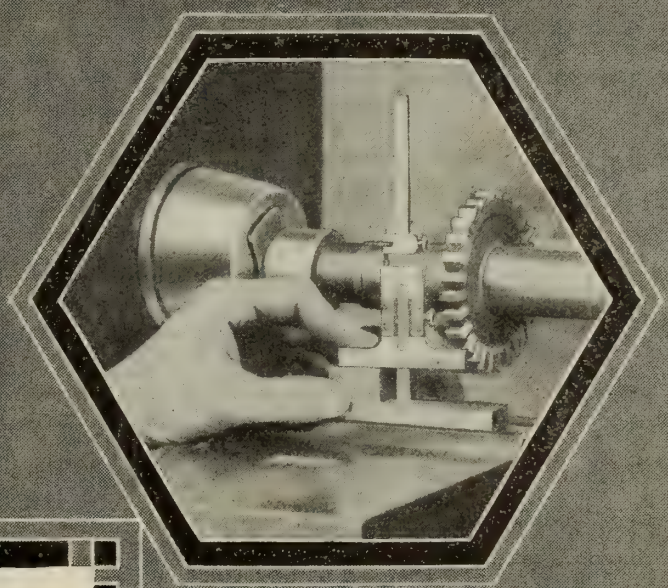
Is The Tool Room Complete?



Wherever Machinery Is Used

Brown & Sharpe Machinists Tools Are Found

In the kit of the oldest mechanic and in the tool room of the most modern shop. Their long-lived reputation for dependability makes them a compelling choice.

Keep up to the high standard of quality. Be sure your tool room is Brown & Sharpe equipped.

"MORSE" DRILLS

HAVE

DEMONSTRATED

THEIR ABILITY TO TURN OUT

ACCURATE WORK

IN

LARGE QUANTITIES

ISN'T THIS WHAT YOU NEED
TO LESSEN YOUR COST OF PRODUCTION?

We will gladly send you a CATALOG on request

Morse Twist Drill & Mach. Co.
NEW BEDFORD, MASS., U.S.A.

"The Marshalltown Throatless Shears"

guarantees perfect work at less than half the ordinary expense.

Rotary, self-feeding shears designed for cutting in and out curves, straight or irregular shearing, circles, also beveling and splitting of plates. Built in various sizes having capacities from tin up to ½" thick. No limit to the size of sheet being cut. Hand, belt or motor drives. The last word in metal cutting shears. We also manufacture Rotary Bevel Shears, Splitting Shears and Plate Milling Machines.

Let us know your requirements.

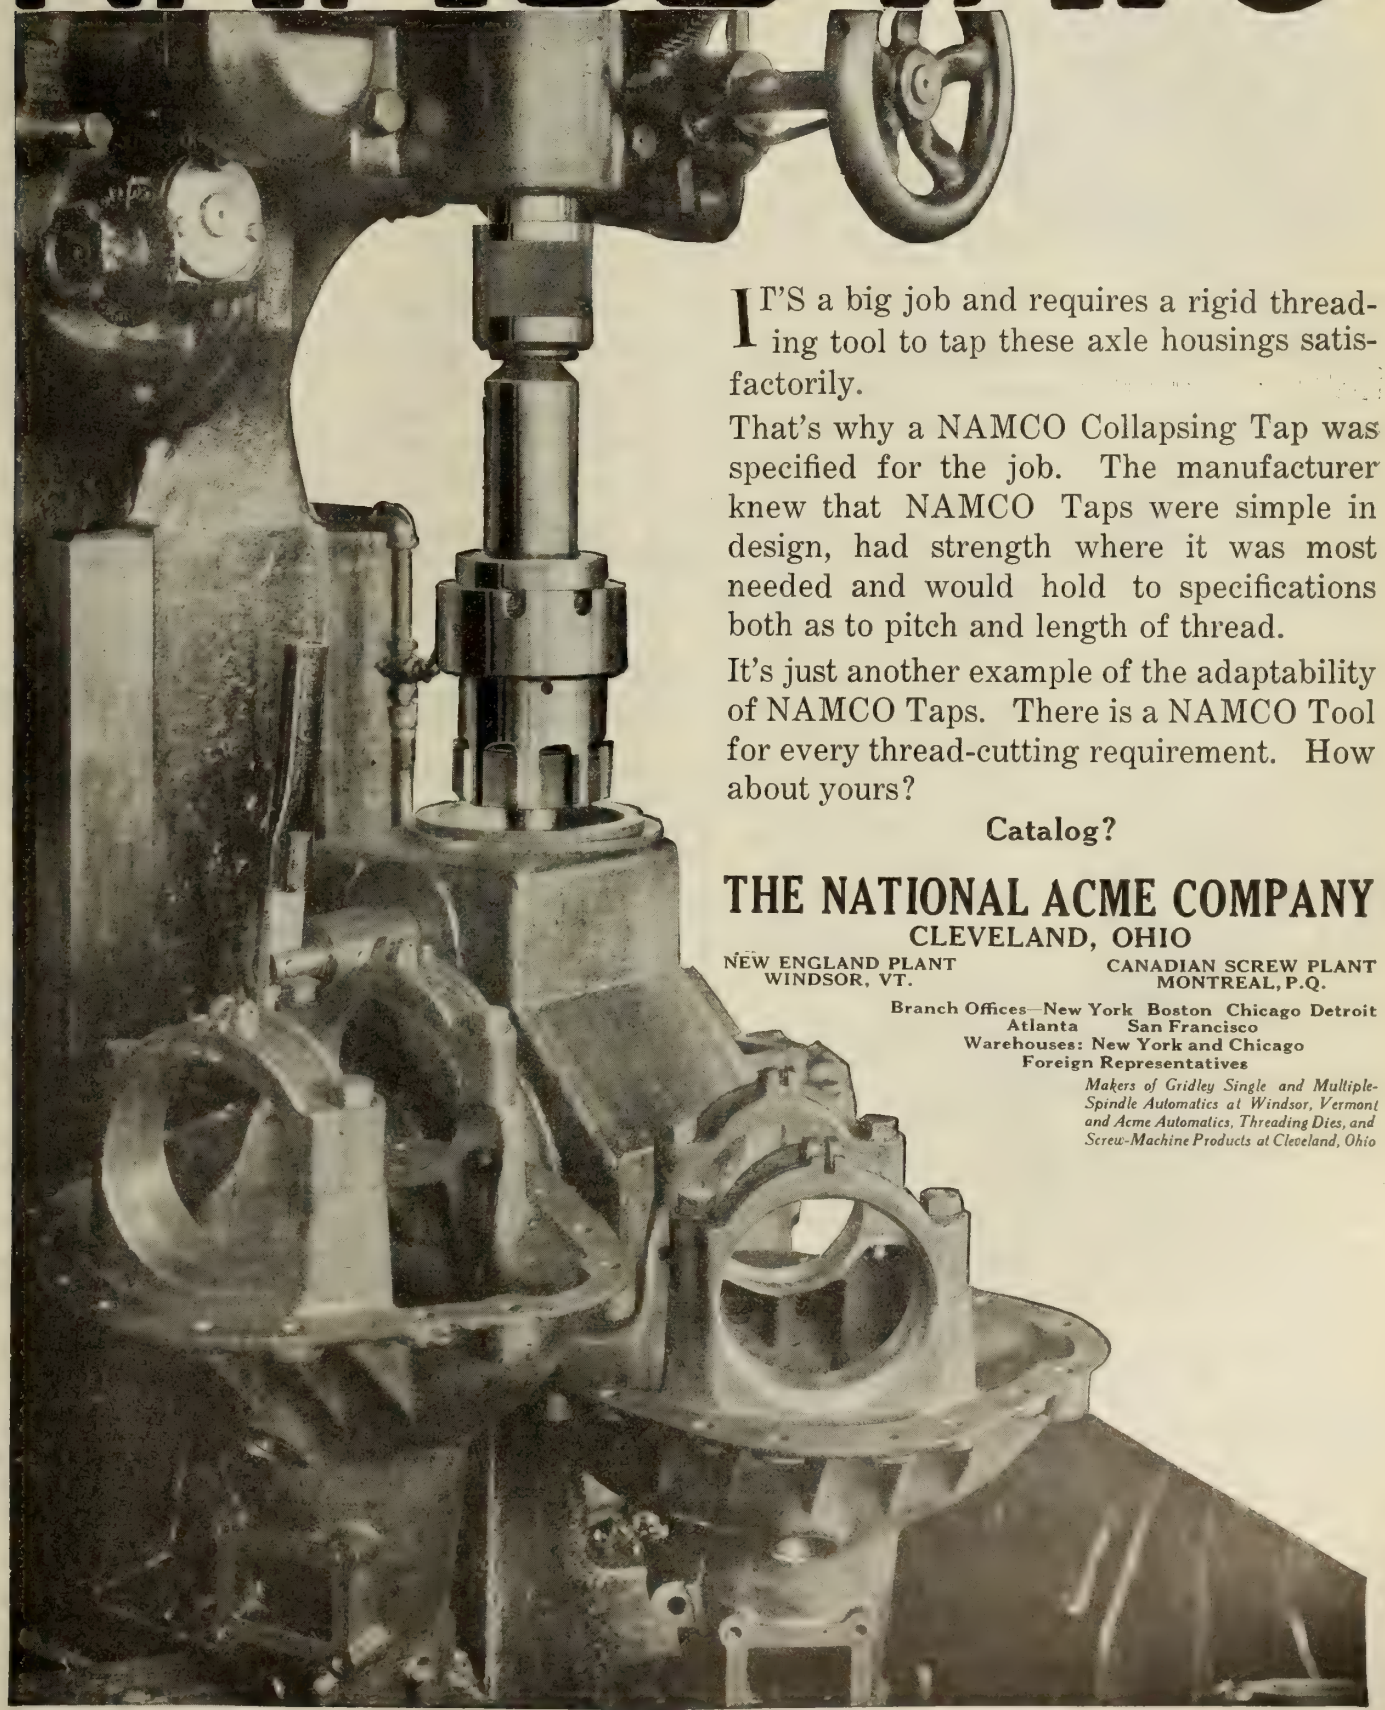
NAMCO TAPS



IT'S a big job and requires a rigid threading tool to tap these axle housings satisfactorily.

That's why a NAMCO Collapsing Tap was specified for the job. The manufacturer knew that NAMCO Taps were simple in design, had strength where it was most needed and would hold to specifications both as to pitch and length of thread.

It's just another example of the adaptability of NAMCO Taps. There is a NAMCO Tool for every thread-cutting requirement. How about yours?

LATHE CHUCKS (See Chucks)

LATHE DOGS AND ATTACHMENTS

Armstrong Bros. Tool Co., Chicago.
Curtis & Curtis Co., Bridgeport, Conn.

The Saving Slip of the Bicknell-Thomas Tap Chuck

is its most important feature. Powerful enough to drive the tap under all ordinary conditions, the friction slips before enough strain can develop to break it. Compact — invaluable on multiple spindle machines. Adaptable — ideal for tapping blind holes.

Made in four sizes—from ⅛ to 1 inch taps. Straight or Morse taper shanks.

Let us send the Circular

BICKNELL-THOMAS COMPANY

GREENFIELD, MASS.

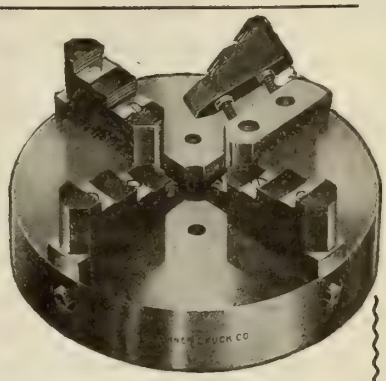
SKINNER CHUCKS



Over 30 years of satisfactory service have placed these chucks where they belong—

On many of America's best machine tools—

In many of the better metal working plants of the world—

In the highest esteem of thousands of operators.

If you use chucks, investigate the Skinner line. It will pay you,

THE SKINNER CHUCK CO.

Williams' Superior Drop-Forged Wrenches

ARE unequalled where exacting service and dependable strength mean speed and efficiency.

There is as much difference in wrenches as in men:—power and worthiness in both are the fruit of careful, systematic development.

That's why the growth, for nearly half a century, of the Williams' Line stands for excellence in design and quality—that's why the words, "Standard" and "Superior," as applied to Williams' Drop-Forged Wrenches mean dependable service under the most severe conditions.

Every one of the 40 patterns in about 1,000 sizes, with openings from 3/16″ to 7 5/8″—**standard** in design and size for every recognized trade need—carries the Williams' guarantee.

When you specify "Williams' Wrenches," you ask for the best.

Our Wrench Booklet gives full particulars.

J. H. Williams & Co.

"The Wrench People"

45 RICHARDS STREET, BROOKLYN, NEW YORK

THE A. G. LOW CO., LIMITED, 45 Pacific Ave., Saskatoon, Sask., Agents for Manitoba, Saskatchewan, British Columbia and Alberta.

Look at this again —closely

and read what we have to say below

WHEN a tap breaks off close or below the surface, you'll find the Walton Tap Extractor will save a great deal of time and trouble. The crucible fingers grasp the flutes of the tap, a twist of the wrench and the piece is out.
Don't you think it would pay to have a few lying around on your benches?

The Walton Company

Hartford, Conn.

We wanted something original— this is what we got

BOTH in these operations and half another — I'll show you later — completed in the time our old taps took to do one; that, I guess, is why we continue to use your Victor Collapsible Taps."

It was the often-heard story of time saved, of costs lowered, of all threads clean and smooth. And it was pleasant to hear.

Victor Tool Company
Waynesboro, Pa.
U.S.A.

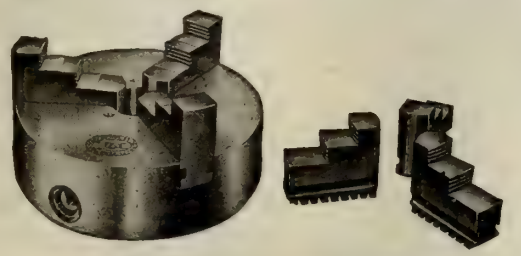
HOYT METALS

"Frost King"
"Trojan"
"Nickle Genuine"
BABBITTS

Hoyt Metals have been used with great success for many years.
Put them to the test and you'll soon see a difference in your babbitt cost.
All elements entering into our mixtures are carefully refined and put together in such proportions and in such relation to each other that the best possible alloy is secured for the work for which it is designed.
Annual sales over $5,000,000.

Hoyt Metal Co., Toronto
New York, N.Y. London, Eng. St. Louis, Mo.



No. 153 with Two Sets of Jaws.

Union Geared Scroll Chucks

Have many points to recommend them. SOLID BODY —Gives strength and rigidity. WEIGHT—All parts are heavy and strong, and reinforced where necessary.

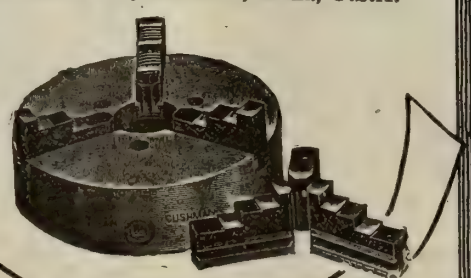
QUALITY OF MATERIAL—Best that can be procured.
LAST AND BEST OF ALL—ACCURACY. Union Chucks are Accurate.
UNION MANUFACTURING COMPANY - New Britain, Conn., U.S.A.
26 Cortlandt Street, New York — Makers of a Complete Line of Chucks

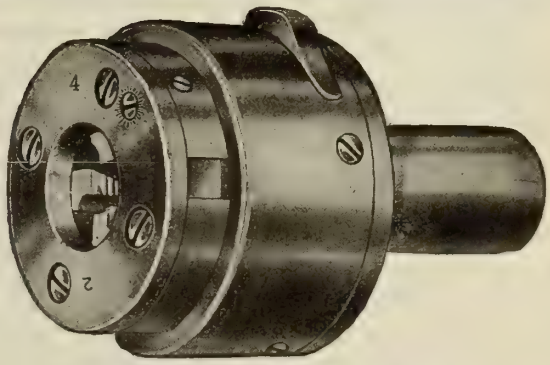
CUSHMAN

We've been Manufacturing
Nothing but Chucks and Their Accessories
FOR NEARLY 60 YEARS
AND OUR PRODUCTS SHOW IT

Years of experience in using our tools has convinced manufacturers that the word "Cushman" stamped upon a chuck is a guarantee of its quality and efficiency.

Let us send you our catalogue.
Cushman Chuck Co., Hartford, Conn., U.S.A.





H & G Die Heads

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

Tools That Retain Their Keen Edges After Long Usage

The condition of Tap, Die and Reamer after long usage proves the stuff they're made of and determines their real value.

Try Butterfield and you'll say they're the cheapest in the long run.

Butterfield

Taps, Dies & Reamers

Butterfield Tools assure the utmost in accuracy and they take heavy cuts with an ease and speed that make the best material look soft.

Let us make you acquainted with them now by sending a trial order.

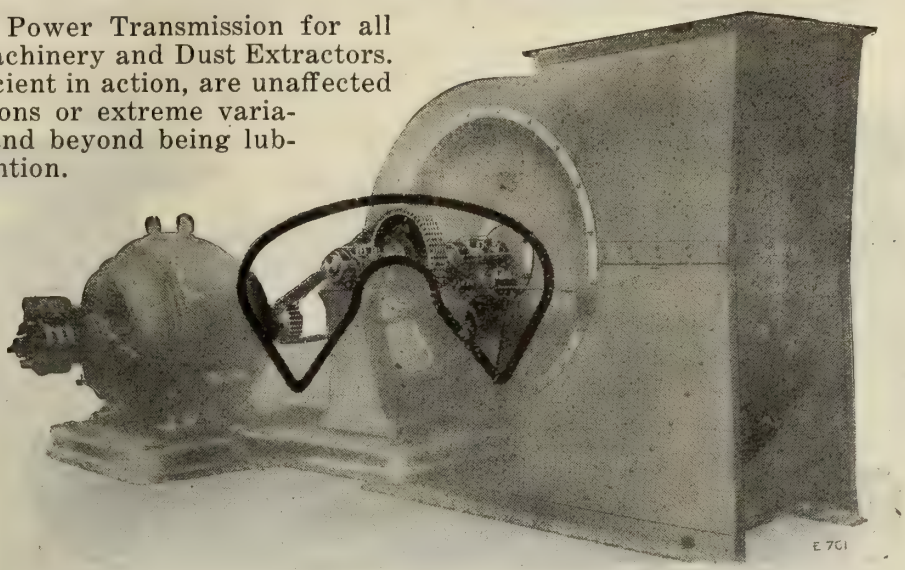
"The Coventry" Noiseless Chains

are the ideal form of Power Transmission for all kinds of Ventilating Machinery and Dust Extractors. They are silent and efficient in action, are unaffected by atmospheric conditions or extreme variations of temperature, and beyond being lubricated, require no attention.



A 25" Keith fan, driven by "The Coventry" Noiseless Chain Motor of 7½ h.p., running at 950 r.p.m., fan 400 r.p.m. This illustration shows how floor space is saved by using chain transmission.

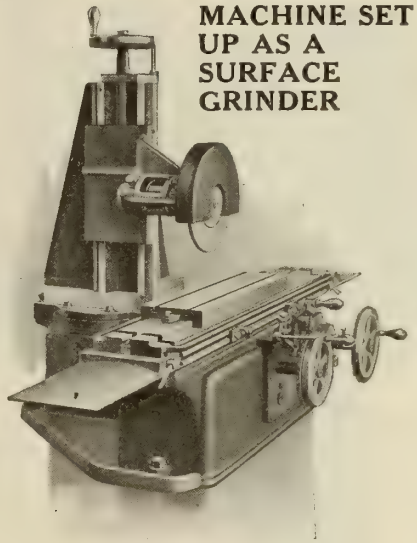
FRASER No. 1 Universal Convertible Grinder

(Patented May 28, 1918)

MACHINE SET UP AS AN INTERNAL GRINDER

MACHINE SET UP AS A SURFACE GRINDER



By the change of heads the machine can be converted into an efficient high-speed internal grinder; also a surface grinder of considerable range.

PATENTED APRON CONSTRUCTION. All the springs on this machine are enclosed and can be removed or replaced without disturbing any other part of the machine.

Capacity: Cylindrical work 8 in. x 2 in.
Surface work, 6 in. x 20 in.
and up to 8 in. in height.

Some of the Lines we represent:

Tungsten Hack Saw Blades	McArthur Beltings
Moore Bros. Files	Wallace Bench Planer
Gray Planers	Kempsmith Milling Machines
Fraser Grinders	Sebastian Lathes
Mueller Radial Drills and Lathes	Monarch Lathes
Sidney Engine Lathe	Champion Tools
Cincinnati Electric Drills and Grinders	Silver Drills
Elmira Wood Split Pulleys	Sweetland Chucks
Standard Bolt Cutters	Smith & M is Shapers
Racine Hack Saw Machines	Boye & Emmes Lathes

Superior Grinding Wheels

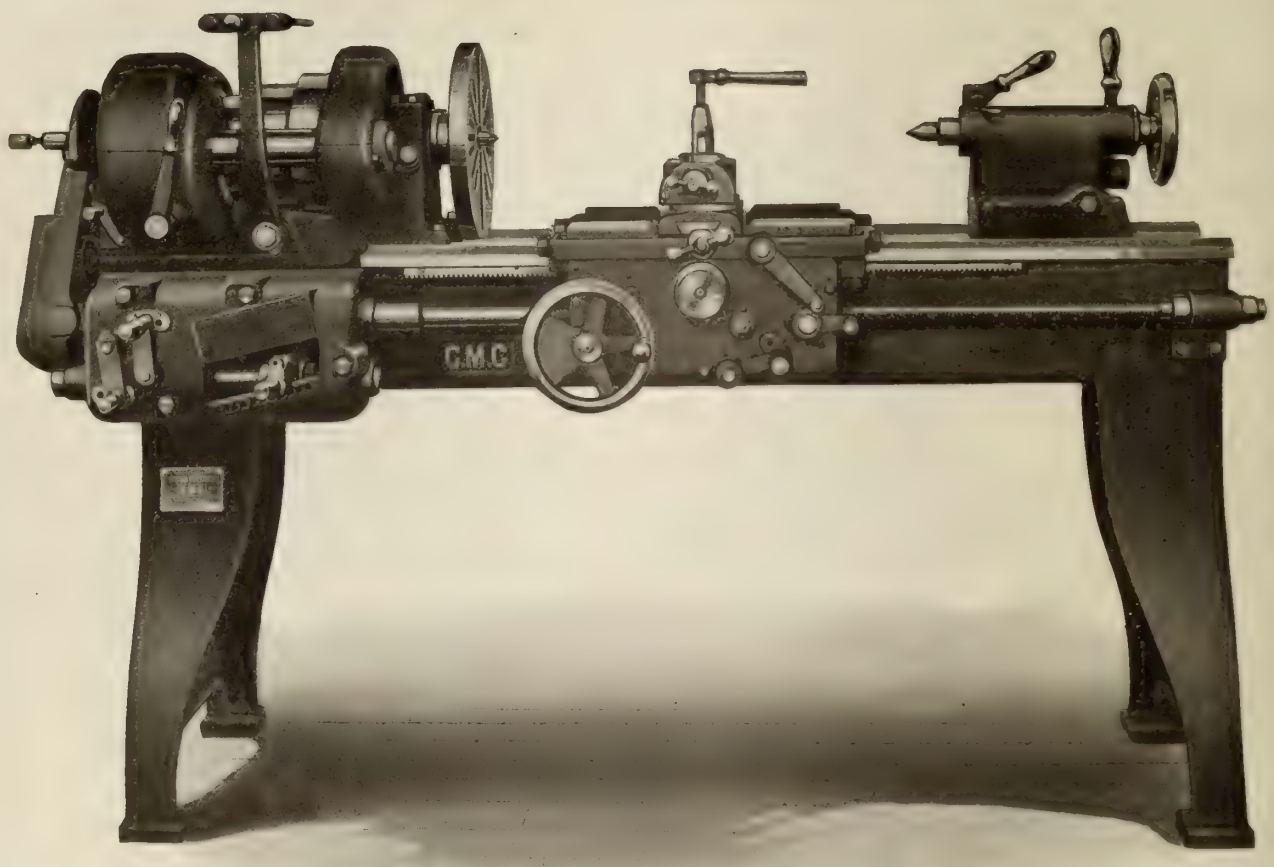
The Geo. F. Foss Machinery & Supply Co., Limited

305 St. James Street Montreal, Que.

Foss QUALITY Foss SERVICE Foss

C.M.C.

14" TOOL ROOM LATHE



Our new 14" TOOL ROOM LATHE besides embodying original and distinctive features possesses that convenience and accuracy for which all C.M.C. lathes are justly noted.

Notice that the "back gear" is at the front of the headstock. This saves wear on the spindle bearings and does away with the operator reaching through or around the belt.

There are other features just as novel and important that we would like the opportunity of demonstrating to you. Better let us send you a special bulletin telling you all about it.

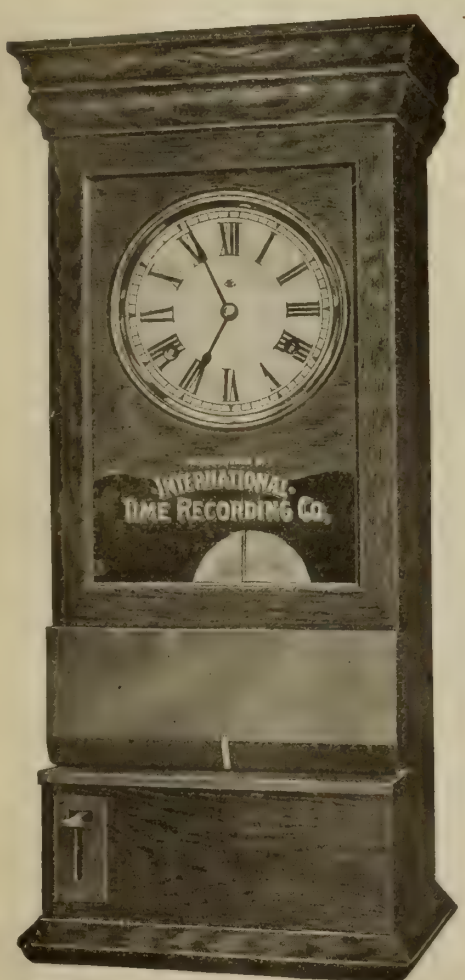
"..... not worth the paper they are written on"



International Job Recorder
"Made in Canada"

We refer to Production Cost Figures that depend on pencil records.

What pencil records?

The time-cards on job work that your workmen or foreman now fill out in pencil.

Why aren't they good in pencil?

Because pencil records can be changed and a working-time balance can be forced.

And, if your factory production costs are "leaky" the whole question of your costs, your overhead, etc., is "up in the air."

The International Job Recorder absolutely corrects this condition. It enforces a printed, machine-made, unchangeable, infallibly accurate record of the time spent on any job or operation.

It does many other profitable things for its users. Let us tell you more about them.

International Business Machines Co., Limited

SMALL TOOLS

Pratt & Whitney Adjustable Blade Reamers

These reamers have eccentric relief and can be set to size without regrinding. They are unexcelled for design and simplicity and ease of adjustment.

The eccentrically relieved blades are stronger than others, do not chatter, and produce a smoother hole. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches. The bottom of a hole can readily be faced.

By a simple adjustment of the blades the reamer can easily be set to size, without regrinding.

Prompt service is assured at our nearest store, where P. & W. Small Tools are carried in stock for immediate delivery. Place your order there to-day.

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

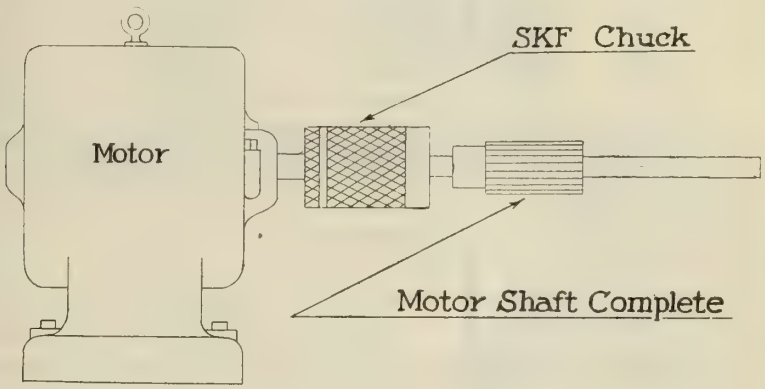
ALGOMA STEEL CORPORATION

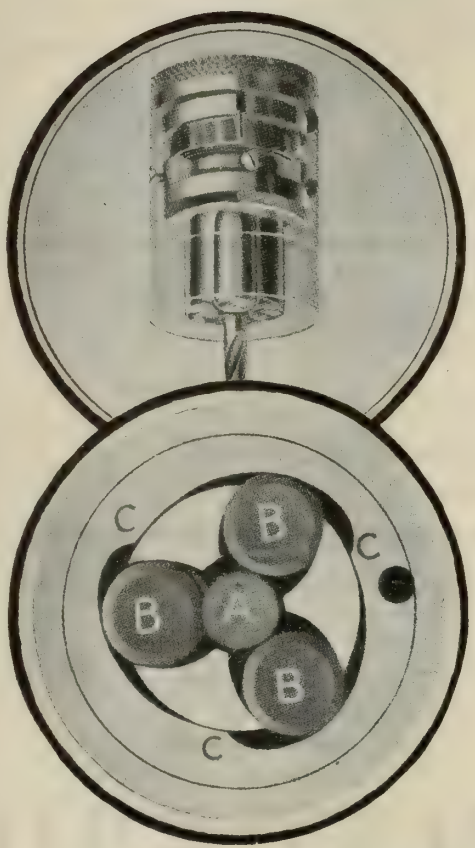
SAULT STE. MARIE, ONTARIO

SKF AUTOMATIC-QUICK ACTING SELF CENTERING DRILL CHUCKS

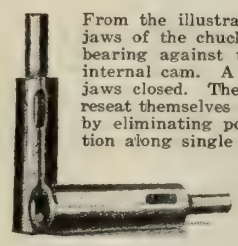
Suggestion No. 2 →

For Polishing Small Motor Commutator





A—*Drill Shank*
B—*Roller Jaws*
C—*Cam Surfaces*



Increase Size Range by using Adapters

From the illustration it will be seen that the jaws of the chuck are formed by three rollers bearing against the surfaces of a three-lobed internal cam. A coiled spring holds the roller jaws closed. The rollers are free to turn and reseat themselves with every drill release, thereby eliminating possibility of wear or indentation along single line of contact. The drilling resistance forces these rollers up the cam surfaces, causing them to close upon and grip the drill shank with a power always proportionate to the drilling stress, thereby precluding slipping of the drill under any conditions whatsoever.

Polished and Removed without Stopping the Motor

THE S K F Chuck is a drill chuck in only the ordinary sense of the word. In hundreds of plants all over the country it is doing things never even associated with an automatic drill chuck.

For instance, the above drawing shows how one manufacturer mounts an S K F Chuck on the end of a motor shaft, to receive small parts for polishing. All day long, small armatures and shafts are inserted, polished and removed without even stopping the motor for a minute.

This is only one special application of the S K F Chuck. Other applications showing the uses of this novel chuck are illustrated in additional booklets which will be sent on request.

OUR AIR COMPRESSORS ARE ACCESSIBLE

One of the most important points about an air compressor is that it should be so built that inspection and cleaning can be done with the least amount of trouble. The horizontal type of construction which we have adopted is particularly handy—cylinder valves, etc., are readily accessible; crossheads and guides can be inspected and cleaned without unscrewing bolts and removing plates; and the crank, etc., are available for inspection simply by lifting off a cover.

Write for our compressor bulletins for further information.

WILT

HIGH SPEED AND CARBON
TWIST DRILLS
REAMERS AND MILLING CUTTERS

Quality First

The Keystone Upon Which All WILT Products Are Built

A high standard of perfection is maintained throughout the various processes of manufacturing **WILT High Speed and Carbon Twist Drills, Reamers and Milling Cutters.** **WILT** products improve production! This is no theory, no untested statement, but an established fact backed by many of the largest manufacturers throughout Canada. For steady, reliable output of work that is satisfactory from the standpoint both of quantity and quality there is no better choice than **WILT Products.**

Put Them to the Test

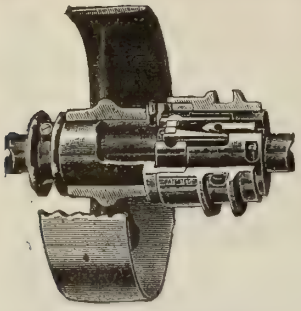
THE JOHNSON FRICTION CLUTCH



Standard Single Clutch with Pulley Mounted on Hub —Clutch Engaged

MANUFACTURERS who are particular about keeping an established reputation equip all their machines with Johnson clutches. They recognize that superiority must be consistent in order to count. And Johnson clutches assure them of uniformly good service wherever they are installed.

Other clutches might work well in some cases—but Johnson clutches are *sure* for all purposes. We study each application on its own conditions, and build a clutch that is just right for the job.

When you are tired of experimenting, let us have a chance.

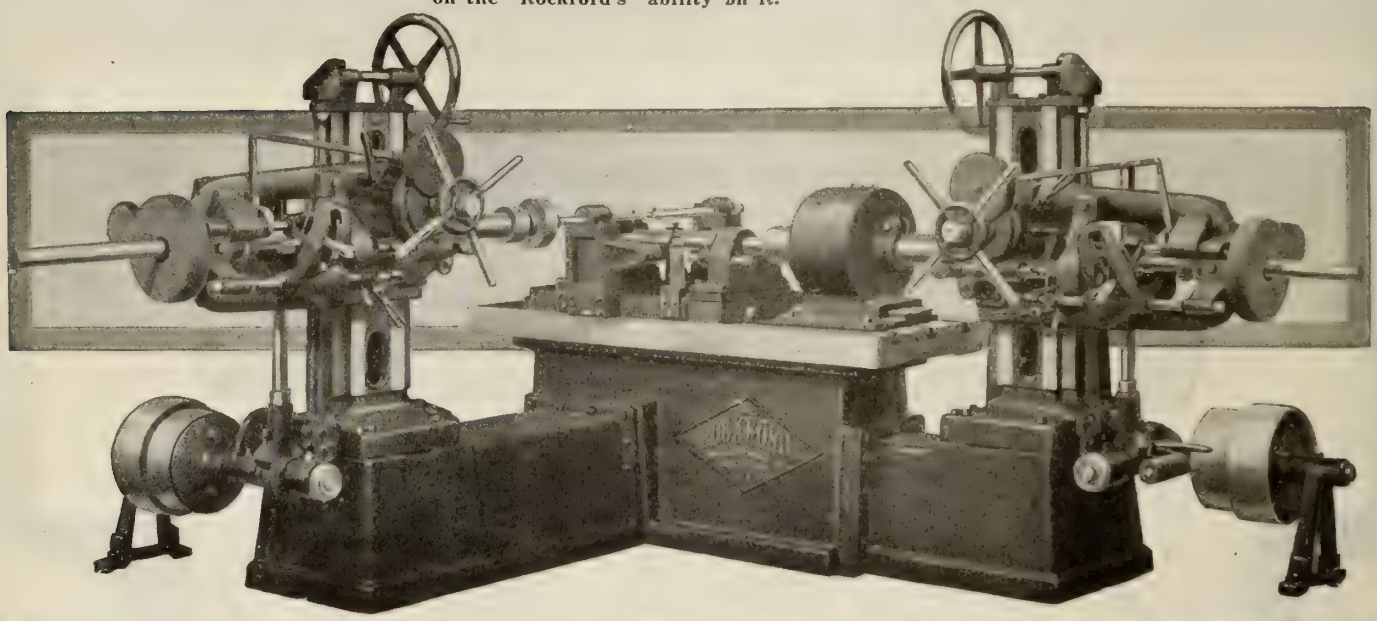
Rockford Horizontal Boring Machine

For Automobile Manufacture

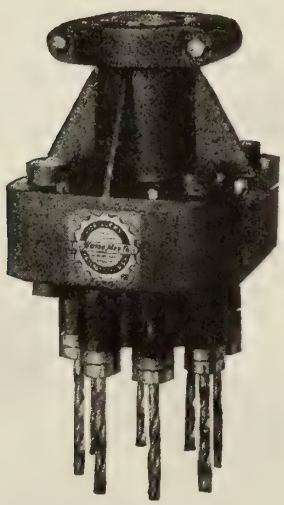
This tool is unusually rapid and accurate in the boring of crank cases, transmission cases and rear axles. Has two heads at right angles to each other. Spindles bore longitudinal and cross holes in work simultaneously.

Send us blue prints of your boring work and we will give you figures on the "Rockford's" ability on it.



The Rockford Drilling Machine Co., Rockford, Ill.

2 Minutes or 20?



This Is The Vital Question

Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

Built For a Long

Because Robertson Process Metal does not need paint, because it is rust proof, because it will withstand the most severe weather exposure and because it is unaffected by strong acid and alkali fumes, it is a permanent, economical building material. By offsetting depreciation and protecting plant investments it has saved plant owners many thousands of dollars.

To know how Robertson Process Metal is made is to understand why it is so enduring. It is made in sheets, and bars. Its body or core, of specially prepared steel, is thoroughly cleansed and covered with three impervious coatings, (1) Asphalt, (2) Asbestos, (3) Water-proofing.

The steel is heated to a uniform and definite temperature and immersed in the asphaltic bath. While the asphalt is still hot it is completely covered with a sheet of asbestos felt and subjected to pressure which thoroughly binds the two protective coats. A coating of water-proofing, forced into the surface by pressure completes the process of protection.

Robertson Process Metal finds its most ready use in sheet form for the roofing and siding of industrial buildings. It is produced in various standard forms and shapes for building trim. Robertson Skylights and Robertson Ventilators are two building products which owe their long life to Robertson Process Metal.

A special bulletin containing descriptions of this product and illustrations of plants where it has been in use for many years will be sent upon request. A general book covering the three basic materials: Robertson Process Metal, Robertson Process Gypsum and Robertson Process Asphalt is also available.

Tires Led the way to Better Hose

THE hose industry stretches back into the early days of rubber history.

For year after year rubber hose had been built upon the immature principles of those early days.

But Goodyear has developed new and higher standards of hose efficiency.

Just as broad-visioned Goodyear chemists and engineers cut loose from tradition and built tires in a better way, so have they built industrial hose.

Old processes—obsolete methods have been forgotten. Only those processes, formulae and methods proved by service tests and experiment to be best enter into the manufacture of Goodyear Industrial Hose.

Hose linings which do not crack or harden have been developed.

Outer covers with an exceptional degree of toughness to withstand the wear of severe industrial service—another distinctly Goodyear feature.

In a word, Goodyear has built better hose. Original cost did not count if greater final economy and increased efficiency were a sure result.

You cannot know how far short of complete satisfaction ordinary hose falls until you experience the greater perfection of Goodyear Industrial Hose.

Give Goodyear Hose a trial now. There is a particular Goodyear Hose for every industrial purpose—water, steam, pneumatic tool, air drill, railway, fire, suction, etc.

Phone, wire or write to the nearest branch for a man trained in hose problems to study your needs. No obligation.

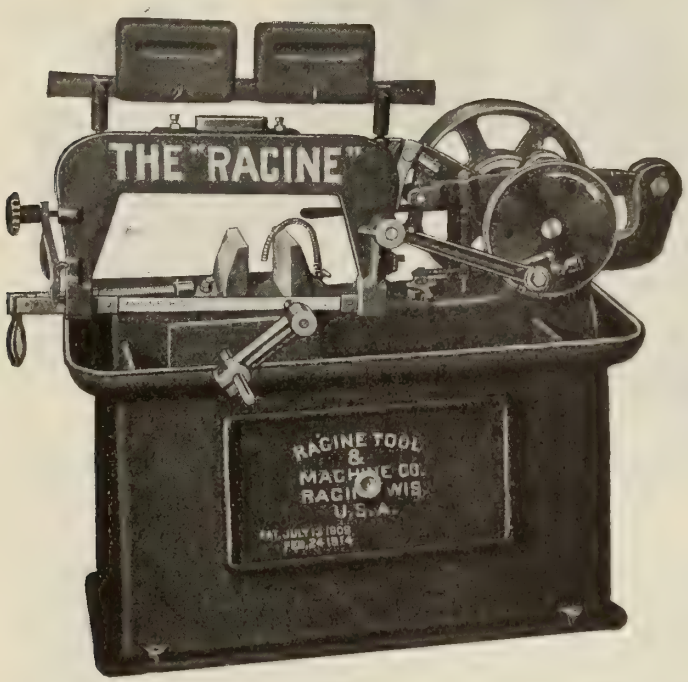
"THE RACINE"



HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

HACK SAWS AND GUMPTION

Every box of Starrett Hack Saws has everything in it that means economical work, except common sense or gumption. It's up to the man who uses the blades to supply that.

If he'll follow the Starrett Hack Saw Chart he's sure to use the right blade for each material—and that's a big step in the right direction. But to get everything out of a Starrett Blade that we put into it, he's got to use common sense.

Hack Saws won't cut economically without pressure or weight. They won't keep on cutting economically unless the weight is increased as the saw becomes dull. A blade won't keep its temper without the use of plenty of lubricant to cool it and it won't do its best if the work is cornered wrongly in the vise. But any Starrett Hack Saw, used according to the recommendation of the Starrett Hack Saw Chart, plus the common sense that every good machinist has, will prove what most users say of Starrett blades—"They cut quicker and last longer." Ask for Catalog No. 21-3 sent free.

Notes On Grinding

NORTON COMPANY, WORCESTER, MASS.

No 50A.

Grinding Wheels for Removing Burrs after Electric Welding

WHEN Electric Welding came into general use, another interesting grinding operation was presented to the wheel manufacturer. Back in 1897 when this process was first introduced, the difficulty of removing the rough burrs left when two pieces of metal were welded together was greater than it is to-day.

In those days grinders were dependent on emery as the abrasive for grinding away the rough parts of the joint, leaving a smooth surface. Emery with its weak structure broke down very quickly under this severe test. Besides, emery grain contains a high percentage of magnetic iron oxide, which has practically no cutting action. Both of these properties cause high wheel wear in this class of work. Not until the tougher artificial aluminous abrasive which we call Alundum was discovered and manufactured into grinding wheels did this class of grinding become economical and universally adopted.

To-day we find hundreds of manufacturers snagging and grinding after welding, in a most efficient and entirely satisfactory manner. From car rails to small tubing joints Alundum wheels of coarse grain and medium hard grade are producing good finished results. A good idea of these more satisfactory results can be obtained from the following selected examples.

For grinding welded wire wheel hubs dry, 36-P Alundum wheels on a floor stand have been reported as highly efficient, while 46-P proved to be too fine and slow cutting.

A 36-R Alundum wheel used for snagging steel sheets, such as those on metal seats, stood up much better than the softer grade Q and produced 1,040 pieces during its life of 65 hours.

In the operation of grinding the weld burrs on inlet and outlet pipes that are welded to cylinders a 24-R Alundum wheel was more satisfactory than a softer wheel.

When grinding the burrs on steel rails after welding, a coarse wheel should be used. In one instance the railroad men were convinced that a 16 x 3 x 1½ 14-R Alundum wheel was the best on their track grinding machine. In another the experts in a public utilities company in Indiana state that a 24-O wheel is "satisfactory in every respect."

From the above illustrations and many others of a similar nature it is noted that in the majority of cases where trials were conducted on grinding of this kind the operator discovered that he was using a wheel that was too soft and in some instances too fine. From these observations, if you are doing this kind of grinding and the results are not what you think they should be, if you will write to the Norton Sales Engineering Departments stating the kind of grinding and conditions surrounding your work they will be glad to render what assistance they can in helping to solve your problems.

MATTHEWS Pittsburgh Bevel Steel Letters and Figures

Hand Made

Matthews' Letters and Figures are hand made from carefully selected tool steel. The characters are neatly formed, producing stamps that make easily read and durable marks on all classes of products. They reduce considerably the cost of high grade marking.

Try them! Mark your next order — "MATTHEWS' Letters and Figures."

TRAHERN PUMPS

We positively guarantee that our pumps will deliver all the coolant that can be forced through the discharge opening, according to the size of the pump used, while operating from 300 to 500 R.P.M. A centrifugal pump delivering the same sized stream of lubricant must operate at a speed of at least 1000 R.P.M. This excessive rate of speed necessarily results in a short lived pump.

A Trahern operates at low speed and has long life.

A Discussion of the Various Types of Jigs

The Second and Last Portion on This Subject. As Before Stated, There is Generally a Fundamental Principle Involved in Jig Design, Which is Varied to Suit the Requirements

By ROBERT MAWSON

THE illustration, Fig. 1, shows a type of simple, single clamp jig.

The knurled head pin A is made with a thread which screws into the body of the jig. When placing the part to be machined in the jig the screw is therefore first removed. After this has been done the clamp B may be removed.

The part C is then placed into the tool, being located by the pin, as shown. The clamp is next placed over the piece, being located for position by means of the pin D.

The other edge of the clamp rests against the steel block E.

The piece then sets between the front edge of the clamp and the wall F.

The screw A being then tightened forces the clamp down, and this action holds the part between the two surfaces noted. It will be noticed that the rear —left end—of the clamp is made with a raised portion or heel, and as the forward end is made slightly tapered in a vertical direction, the simple action of tightening the screw forces it down and therefore the clamp performs the dual purpose of positioning the piece and also holding it securely in the jig.

It is obvious that the hole in the clamp must be made slightly larger than the body size of the screw to allow the clamp to rock.

Three holes are then drilled in the element, the drill being guided through the holes shown at G, the tool resting with its rear vertical surface on the machine table.

Positive Location Type

It will be readily conceded that when positive locations for the piece can be used there is less chance of error than where the locating depends on the operator. The photo, Fig. 2, shows an open type-positive location jig.

The casting machined in the tool has been previously bored and a slot milled in the centre of a machined face.

The piece is therefore placed on a plug A, which accurately fits the bored hole and is also located by a tongue B, which also fits the machined keyway.

The four hook bolts C are then turned with their heads over the casting and the jig reversed to the position shown in Fig. 3.

The thumb nuts A are then tightened by the operator, which pulls up the casting securely into the jig.

The various holes may be then machined, the tools being guided through the various bushings shown in the usual manner. Legs are provided, the purpose of which has been previously noted.

This type of jig gives excellent results, as it is quick acting, positive and therefore produces accurate, interchangeable parts.

The next illustration, Fig. 7, shows another positive location jig of a somewhat different design.

This casting is again located by a circular plug A and key B, these elements fitting into surfaces which have been accurately machined in previous operations. The open washer C is then slid over the screw, as shown, which is then tightened down.

The small clamp D is then turned to the position it occupies in the photo and the small screw being tightened against the clamp assists in holding the casting.

Holes are then machined in the piece, the jig being turned into four positions, the one shown, the front face on the table, the left side resting on the machine table for the third position, and the right side for the fourth drilling operation.

Simple Holding Jigs

It is sometimes advisable to provide a medium for simply holding a part to be drilled.

This may be the case where a casting is somewhat fragile or of awkward shape.

In Fig. 4 is shown such a holding device, the tool being not provided with guide bushings for the drilling operations. The casting is located on a pin which fits into a reamed hole A, which has been previously machined.

The casting is then revolved on this stud until the piece comes in contact with the pin B. The strap C, which is of the open-ended type, is then fastened onto the casting by means of the long setscrew shown.

It will be noticed that when the casting has been located and held in the manner described, all the various bosses rest on supports.

The operator then centre-punches these bosses and drills a hole in each.

By the use of such a simple holding device the casting is held rigidly for the drilling operation, which may therefore be performed more quickly and satisfactorily.

The next tool, Fig. 11, is also a holding jig, but is provided with guide bushings. In reality it is the second operation on the casting previously shown.

The piece is again located on a pin A. The screws B are then tightened until the casting is central between the guide bushings.

This can be readily done, as by tightening one more than the other the casting will oscillate on the pin until the desired position is obtained. The open washer is then fastened against the casting by means of the screw in the pin A, which holds the piece securely in the jig.

The various holes are then drilled and the guide bushings may be observed immediately above the bosses.

Tools of this nature, where no guide bushings are used, or where the casting may be revolved to suit the condition of the casting, are permissible where the holes machined are of an independent nature, or in other words, when their position is not relative to other elements on the machine or design.

Jig With Holding Handle

The illustration, Fig. 5, shows a handy type of jig, fitted with a handle

which affords a convenient medium for holding during the machining operation.

When placing the piece in the jig, the cover A is first raised, the projection at the end providing a handy hold for the fingers. To raise the cover the knurled head pin B is first pulled out.

The casting is located by means of pins, the knurled headscrew C forcing the piece back against the locating pins. The screw is placed at a slight angle, so that the pressure forces the piece both into the jig and also back against the pins.

The cover is afterwards dropped down and held with the knurled head pin A. Holes are then drilled in the piece, the jig being placed in the position shown and then turned over with the rear face resting on the machine table.

It will be noticed that the jig is provided with narrow bearing surfaces on both faces, which rest on the machine table.

This is an advantage, as it reduces the possibility of dirt or chips getting under the faces, which would thus prevent accurate drilling.

The interesting feature of this tool is the machine steel handle E, which is forced into the body of the jig.

This attachment provides a handy medium for manipulating the tool to the various drilling positions.

The photo, Fig. 8, shows a jig with a wedge pin for locating the piece.

To use the tool the knurled head pin A is first slid out, and the piece pushed in from the front.

The casting then rests on the height pin B, which also acts as fulcrum.

The knurled head pin is then inserted again, fitting into a reamed hole in the arm C. It will be observed that the upper surface of the pin is machined with a flat surface, this being also made at a slight angle. As the operator therefore pushes in the pin the inclined surface acts as a wedge and raises the casting into the locating vee block D.

This simple angle device not only raises the casting, but its position or distance which it may be pushed in accommodates any slight discrepancy on the outside diameter of the piece.

The jig is made with an inserted steel guide plate E, which permits the making of the tool to be much simplified.

The guide hole for the drill on the upper surface on guide plate may be noticed by referring to the illustration.

A Triple Angle Jig

The next example, Fig. 9, shows a triple angle jig with a positive location. The casting is placed into the jig after the latch A has been raised.

The piece is located by a tongue B, which accurately fits into a slot which has been previously machined. The latch is then dropped down and the screw C

FIG. 5.—JIG FOR HOLDING HANDLE.
FIG. 6.—JIG WTH SEPARATE ANGLE BLOCK.

tightened against the piece, either by using a wrench or screwdriver.

It will be seen that this screw is placed at an angle with the base of the casting and when tightened the pressure both forces the piece back to a stop pin and also down onto the locating key.

In this tool holes are to be drilled at three different angles, the three surfaces D are therefore made with similar angles to obtain this result, these surfaces or bases resting on the machine table when drilling the holes in the guide plate opposite.

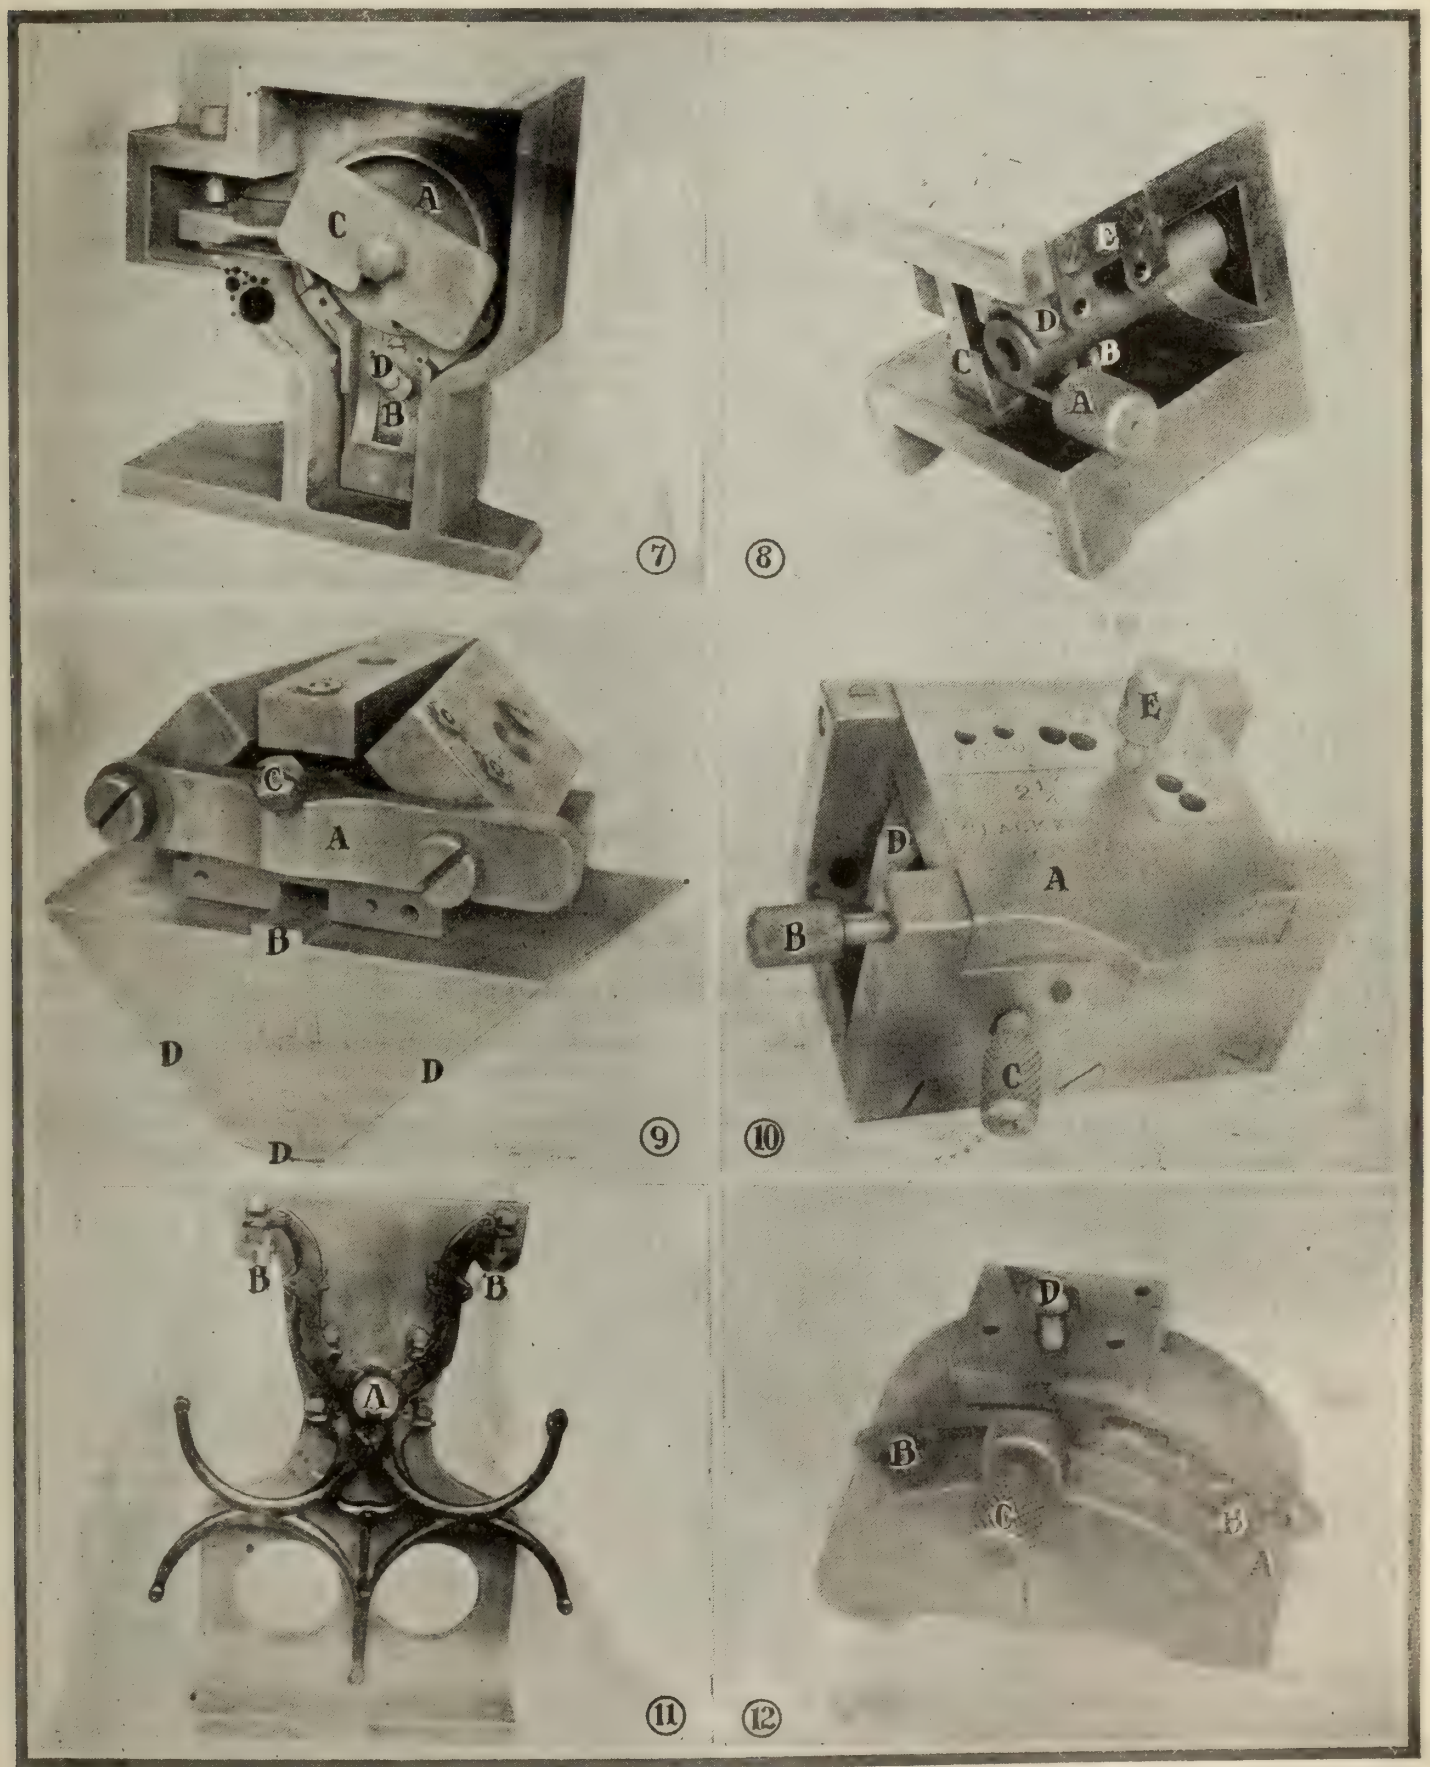

FIG. 7.—POSITIVE LOCATION JIG.
FIG. 9—TRIPLE ANGLE JIG.
FIG. 11.—HOLDING JIG WITH BUSHINGS.

FIG. 8.—WEDGE OPERATED JIG.
FIG. 10.—BOX TYPE OF JIG.
FIG. 12 PROFILE TYPE OF JIG

The illustration, Fig. 10, shows a box type of jig.

To place the piece into the jig the cover A is first raised by sliding out the knurled head pin B.

The piece is then put in the jig and the cover dropped down and fastened with the pin.

The knurled headscrew C is then tightened against the piece which pushes it against the stop plate D.

The screw E is next tightened onto the piece to hold it securely in the jig and also against the drill pressure.

The various holes are then machined in the usual manner.

A few words might be added about box jigs. It is advisable not to use them whenever possible for the following reasons:

They are usually more expensive to make, they are also much more difficult to keep clear of chips, and again, owing to the fact that the piece being drilled is out of sight, it is easier to make a mistake during the machining operation as the man cannot observe the progress of the work. When it is found absolutely necessary to make this type of tool, the question of expense must be controlled by the best design.

Chips may be removed in a small jig by plunging it after each drilling into a pail of kerosene, and mistakes in drilling can be only avoided by vigilance of the operator.

On a large jig holes to permit the chips and dirt to fall away from the locating surfaces should be always provided.

Jig With Separate Angle Block

When designing a jig for machining holes which are not in the same plane, it is often a problem to the designer whether to make the bases at the desired angle (as has been already illustrated) or use a separate angular block.

The practice of making a separate block will be usually found to be cheaper, as the main jig can be designed much simpler. The illustration, Fig. 11, shows a jig which has been made with a separate block or angle.

The casting is dropped into the jig after the cover A has been raised, and located against stop pins.

The cover is then fastened down by means of the knurled head pin B.

Holes are afterwards drilled in the piece, the drill being guided through the bushings C. The jig is then placed with the surface D resting on the face E of the angular block. It will be observed that this element is made with a ledge at the lower edge to prevent the jig sliding away from the block.

When the jig is in this position, the surface F is horizontal, so that a hole may be drilled in the casting, the bushing may be seen in the surface noted.

Fig. 12 shows a jig made with a profile surface to suit the contour of the piece to be machined.

This profile slot is made only part way around the jig, the blind end acting as a stop.

The piece is slid in from the left-hand end until it comes against the end A. The upper part of the piece also rests against the two pins B. The knurled headscrew C and wingscrew D are then tightened onto the piece to hold it securely in the jig. Holes are then drilled in the usual manner.

In this article I have endeavored to show some of the leading types of jigs used and analyze their features. I can only hope that it will be useful for not only the designer, but also the small shop, where tools are just made, often without any idea as to why things are done one way and not by a different method.

The Fundamental Principles of Safeguarding

A Paper Presented Before the A.B.C. Session, Eighth Annual Safety Congress, Cleveland, on the Subject of What Shall I Guard and How Shall I Guard It

By SIDNEY J. WILLIAMS, Secretary and Chief Engineer of the National Safety Council, Chicago

THE first half of our subject is, What shall I guard? The second half is, How shall I guard it?

If you want your plant to be 100 per cent. safe, the answer to the first question is, Guard every moving part, wherever located, on which a workman might be injured if he came in contact with it in any way, or from any cause whatsoever. If the moving part is in a place "where nobody ever goes," remember that someone is likely to go there sooner or later, in connection with the repair or maintenance or alteration of the machinery itself or of the building, or for some other reason which you cannot anticipate. You probably have heard the classic story—a perfectly true story—of the man whose heel was cut off by an unguarded gear 14 inches below the ceiling. The man was standing on a scaffold, working on another shaft nearby; to brace himself he placed his foot against the shaft on which the unguarded gear was located, his foot slipped, and was caught in the gear. Many similar examples could be quoted of accidents occurring in out-of-the-way places. Recognizing this fact, the Illinois Steel Company rule book, to mention only one example, requires that all gears, wherever located, must be enclosed.

You may be puzzled by attempting to apply this principle to the guarding of overhead shafting and belts. Many shafts contain miles of overhead shafting, which it is almost a physical impossibility to guard. On the other hand, oilers and repairmen are frequently injured, sometimes fatally, on unguarded overhead shafting or belts. The only solution is, if the shafting positively cannot be guarded, to prohibit absolutely any work on such overhead transmission while it is in motion. Repair work, shortening of belts, etc., can be done during the noon hour or at night; oiling likewise—or, better still, install automatic oilers or oilers which can be filled from the floor by using a special oil can with long spout.

A gear or belt or other dangerous moving part which happens to be located below a table, or in some other place where it is partially hidden, is not thereby made safe. Someone occasionally must reach under the table to sweep or repair the floor or oil or repair the machine. Someone may slip or stumble so that his arm comes in contact with a gear or belt which would be safe for the workman standing in his normal position. The immigrant totally ignorant of machinery—and it is hard for us to realize the completeness of the ignorance on this subject, on the part of foreigners brought up in farming districts—may deliberately put his hand or his finger into an opening that looks interesting, just to see what it is. If he finds that "it" is an unguarded gear, it is easy to say that the accident is his own fault—but that does not relieve our obligation to pay his compensation, nor does it restore him to his vacant place in the gang.

What I have said of gears and belts applies equally to any moving part on which a man might be injured—counterweights, cranks, reciprocating parts such as a planer bed, and so on; also, of course, to the operating point of machines.

The second half of the problem is, as already stated, "How shall I guard it?" Here are a few points to remember:

1. A safeguard should be so designed and constructed that it will prevent all accidents on the part guarded—not only accidents to the operator while at his regular work, but also to the operator or passers-by in case they slip or fall, or carelessly touch the machine.

2. The guard should not interfere with production. If it does, it is liable to be taken off. In designing a guard it is generally wise to consult the man who will use it.

3. In general, the guard should be attached to the machine and not to the floor; if attached to the floor, use a connection which will interfere as little as possible.

4. The guarded part must be accessible for oiling, inspection, and repair. The door or removable section provided for this purpose should be hinged or otherwise attached to the remainder of the guard, or to the machine. If not, it is likely to be left off permanently.

5. The guard should not interfere with cleaning and sweeping around the machine. It should, therefore, be kept generally about six inches above the floor.

6. The guard should be strong enough to resist injury and keep its shape. A light, flimsy guard soon becomes bent and is discarded. A substantial guard is cheaper in the end.

7. Incombustible guards are preferred. Wooden guards, soaked with oil, may become a serious fire hazard. Metal guards are neater and wear much better. "Metal guards look as if you wanted to; wooden guards look as if you had to." Guards may be made of cast iron, sheet metal, wire mesh, expanded or perforated metal, or slats. Where subjected to acid or fumes, wooden guards may be necessary.

8. It is desirable to interlock the guard with the operating mechanism, where possible, so the machine cannot be operated unless the guard is in place.

9. A safeguard can often be so designed that it will also serve to prevent wear on the parts guarded—for example, a solid gear enclosure.

Let us consider the application of these suggestions to the design of gear guards. Cast iron guards are preferred because they may be made to fit more snugly, present a better appearance, and protect the gears from dust and injury. In shops having similar gears on several machines, the cost of patterns and cast iron guards will be no greater than the cost of "built-up" guards. A cast guard of one machine may be used as a pattern for making guards for similar machines.

Guards for a variety of machines, and in many sizes, may be more cheaply made of sheet metal. In large guards, an angle iron is used to make the joint between the flat sides and the curved part of the guard. In smaller guards this joint may be made by cutting projections (like saw teeth) on each side piece and bending these over to form a smooth curve. The joint may then be made either by spot welding or by riveting. Short pieces of angle iron may also be used to form the joint—about ¾ in. x ¾ in. x ⅛ in. angles, one inch long, 3 in. or 4 in. apart.

Gears should be completely encased; or where this is impracticable, should have a band guard with side flanges extending inward beyond the root of the teeth. If there is a spoke hazard, the gear should be completely enclosed, or filled in between the spokes.

Bolts, flywheels, shafting, and large gears are often guarded by an open-work, rather than a solid enclosure. Such guards should be so designed that no one can get his hand or his finger into the danger point even if he tries. If the guard comes within four inches of any danger point the opening should not be greater than one-half inch square, which is small enough to exclude fingers. If more than four inches away—which is about the maximum length of a man's finger—the openings may be larger than one-half inch, but not larger than two inches square, this being small enough to keep out a man's hand. If a slatted construction is used, the slats should not be more than one inch apart.

The safety engineer's greatest difficulty is in guarding machines on which men are working. Let me repeat that it is very important not to attempt to guard machines in a way which will interfere with production. The great majority of both foremen and workmen will seriously object to such a guard, will use it under protest, and when the opportunity arises they will take it off and not put it back. I have time to mention only two examples—the circular saw and the punch press.

A guard is not the only essential for safety in operating a circular saw. For ripping, it is very important that the saw be provided with a splitter. Keeping the saw sharp and properly set will greatly decrease the danger of throwbacks. The floor where the operator stands should have a nonslip surface.

Many shop men say that it is impossible to guard a circular saw without interfering seriously with operation. The safety rule book of a large company contains a similar statement. In a great majority of the woodworking shops which I have visited, some, at least, of the saws have not been guarded, or some of the guards have not been in use.

I remember, however, two woodworking shops where every saw was guarded and every guard was in use—the Westinghouse Electric and Manufacturing Company, at Pittsburgh, and the Commonwealth Steel Company at Granite City. There doubtless are others, but I do not happen to have seen them. In each of these two shops every circular saw was provided with a guard which completely covered it when not in use and which rose automatically from the table as the stock was inserted. I watched men operating these saws and the guards did not seem to introduce the slightest difficulty. They were of very light construction and when the stock was shoved in they rose without apparent effort—the larger ones, at least, being counterweighted. The men in charge of these departments told me that the guards did not interfere at all with production, and, in fact, that the men now would not work without them because they felt that they were so much safer. I do not blame the workman or the foreman who objects to using a cumbersome, heavy, non-adjustable guard.

Special work on circular saws sometimes is difficult to guard. In some cases these difficulties may be overcome by careful study. In a few cases they probably can not, and the guard must be temporarily laid aside, being hinged or pivoted for that purpose. Where this must be done, another safeguard can often be introduced. For example, in grooving the edge of a board, provide an auxiliary guide or fence, so that there will be a guard on each side of the saw, thus keeping hands away from contact with it.

The punch press—using that common term to include all kinds of power presses—has, with the circular saw, the doubtful honor of causing more injuries, and especially more permanent injuries, than any other kind of machine. Where possible, the best guard is an enclosure around the plunger, which makes it impossible to get one's fingers underneath. Often, however, this is impossible. In such a case, let me suggest that instead of buying a dozen or a hundred of some so-called safety device, and putting it on every punch press in the shop, you start with one individual press and study the operation carefully in co-operation with the superintendent, foreman, master mechanic, and operator of the machine. Ask yourself the question—why do accidents happen or why may they happen on this particular press? The answer will be that, for one reason or another, the operator finds it necessary or convenient to put his hand under the plunger—either regularly or occasionally. The way to make the operation safe, then, is to arrange it so that the operator need not and will not put his hand under the plunger. Some times this may be done by cutting away a portion of the dies, so that the operator can keep hold of a part of the piece being formed and still not be injured. Often it may be accomplished by introducing an automatic or a foot-operated kick out. This almost always increases production as well as safety. Sometimes it is found practicable and advantageous to interchange the upper and lower dies. Sometimes the method of operation may be altered; I have in mind one case where, in riveting the handle socket onto a kettle, the operator laid the rivets in position after the kettle was in the machine and sometimes the plunger came down and caught her finger. After a good deal of study the superintendent arranged to have another girl place the rivets in position and hand the kettle to the operator, who then placed it in the press and completed the operation, obviously without danger and obviously with a great saving in time as well. In a great many cases, where the same operation is continued for a long time on one press ,it will be found economical to provide some sort of automatic or semi-automatic feed; this also always increases production as well as remov-

Continued on page 415

Canadian Machinery Drafting Course, Part IV

In This, the Fourth Portion, We Start in on Six Problems on Geometrical Drawing. This Branch Will Not be Touched on More Than is Absolutely Necessary

By J. H. MOORE, Associate Editor Canadian Machinery

BEFORE going into this subject of geometrical drawing let us say that a groundwork on this subject is absolutely necessary, otherwise we would not take it up. We shall, however, confine the work to three plates, so that only the most important geometrical problems will be taken up. By this means the student will not tire of the subject, for the writer of this series knows from personal experience that the average machine shop apprentice hates the very name or look of this subject. Still in due justice to the course these points should be at least touched upon, so students in general must not forget the necessity of getting in this groundwork of three plates, after which a more interesting section will follow though not more important than this the first of the geometrical series. Above all keep up the good work. We are receiving replies galore so keep sending in your work and secure one of the three prizes given in each part of this course.

Geometrical Drawing

Geometrical drawing is the art of becoming acquainted with the various lines and figures, what particular properties these figures have, and what bearing they have on mechanical drawing. A working knowledge of the problem to be presented in this course is absolutely necessary to a good draftsman, and is of course supplementary to the main idea, namely, mechanical drawing. As the main idea of geometrical drawing is accuracy, students must be sure to have all their drawings neat and accurate, otherwise the purpose of this section is lost.

In geometrical drawings we speak of definitions, which of course means an explanation of the various lines and figures involved in the study.

Geometrical Definitions

Let us see what these definitions are:

A point is used to mark a position and has neither length, breadth, nor thickness.

A line has length only. It is produced by the motion of a point.

A straight line is one that has the same direction throughout. In other words it is the shortest distance between any two points.

A curved line is one that constantly changes its direction. Sometimes it is termed a curve.

A broken line is one made up of several straight lines.

A horizontal line is one that has the direction of a line drawn upon the surface of water which is at rest. In other words a line parallel to the horizon.

Parallel lines are lines which lie in the same plane, and are equally distant from each other at all points.

A vertical line is one that lies in the direction of a cord suspended from its upper end, having a weight at its lower end. It is a line which is perpendicular to the horizon.

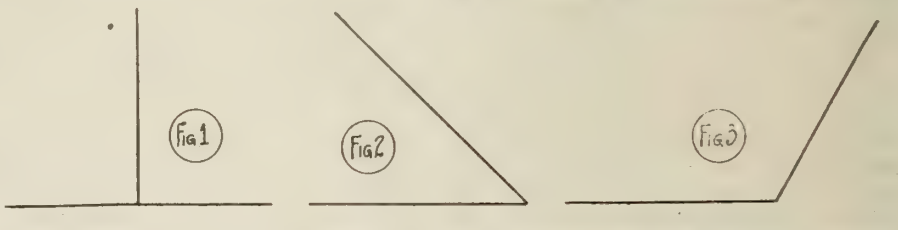
An oblique line is one that neither conforms to the vertical nor horizontal.

Examples of lines already spoken of are as follows:

Lines drawn with the T-square are all parallel to each other. A line drawn by means of the triangle on its straight side, together with the aid of T-square is a vertical line. A line drawn with the sloped side of triangle with same conditions as above will be an oblique line.

If two lines cut each other they are called intersecting lines, and the point where they cut is called the point of intersection.

An angle is the measure of the difference in direction of two lines. The lines are called sides and the point of meeting the vortex. The size of an angle is independent of the length of the lines.



If one straight line meets another, as in Fig. 1, so that the two angles thus formed are equal, the lines are termed perpendicular to each other, and the angles formed are known as right angles.

Should the angle be less than a right angle it looks like Fig. 2, and is termed an acute angle.

Should the angle be greater than a right angle it is termed an obtuse angle and appears as shown at Fig. 3.

Before going further into the other various definitions let us consider these already given as sufficient for the first portion on geometrical drawing. In this way the student will not have to carry in his head too many definitions at once, but will be able to concentrate on the particular ones he requires, so now to Fig. No. 4, and the instructions for the completion of the same.

Instructions

As usual commence by making the border lines 9 in. by 13 in., and the trimming lines 9½ in. by 13½ in. Divide this space into the seven parts as shown in the plate. As per usual, place the title, etc., in the lower space, then place problems 1 to 3 consecutively as illustrated. We will explain the working out of each problem as we go along.

Problem No. 1 (To Bisect a Straight Line)

To construct: First draw a straight line AB 3¾ inches long. With A as a centre, and a radius greater than one-half of the length of the line, describe an arc of a circle on each side of this line AB. With B as a centre and the same radius, describe arcs as before, intersecting the first two at the points C and D. Join C and D by the line CD, when the point E, when it intersects AB, will be the required point. In other words, AE=EB, as E is the middle point of AB.

This problem could also be termed erecting a perpendicular line to a straight line from its middle point, for the line CD is in the middle of AB and is perpendicular to it.

The next problems Nos. 2 and 3 can be classed under the one heading, namely to erect a perpendicular to a given line from a point in that line. We will take up two cases. First in Problem 2 we will take up the problem when the point is near the centre of the line.

Draw AB 3¾ inches long. Let C be the given point on the line. With C as a centre and any radius, such as CD, describe two short arcs cutting AB at the point D and E. With D and E as centres, and any convenient radius greater than CD, describe two arcs intersecting at F. Draw CF and that line will be perpendicular to AB at the point C.

In Problem 3 we take up a case where the point is near the end of the line.

Draw AB 3¾ inches long. Suppose C about ½ inch from the end of the line as shown. With any point D as a centre and a radius DC, describe an arc cutting AB at C and E. Draw ED and produce it until it intersects the arc at the point F. A line drawn through F and C will be perpendicular to AB at the point C.

Problem 4 (Through a Given Point, to Draw a Straight Line Parallel to a Given Straight Line)

First let AB be the given line 3 inches long. Let C be the given point

With C as a centre and any convenient radius, describe an arc DE intersecting AB at E. With E as a centre, and the same radius, describe the arc CF intersecting AB at F. With E as a centre and a radius equal to the chord of the arc CF, describe an arc intersecting DE at D. A straight line drawn through D and C will be parallel to AB.

Problem 5 (To Bisect a Given Angle Where the Sides Intersect Within the Limits of the Drawing

To construct. Let ABC be the angle to be bisected.

Draw the sides AB and BC 3¾ inches long. With B as a centre and any convenient radius describe the arc DE intersecting AB at D and BC at E. With D and E as centres, and a radius greater than the chord of half the arc DE, describe two arcs intersecting at F. A line drawn through F and B wil bisect the angle. In other words ABF will equal FBC.

Problem 6 (To Contruct an Angle Equal to a Given Angle)

Draw AB 2½ inches long, and the line BC 2½ inches long. The angle formed by these lines may be any convenient size; in this case we will call for 45 degrees. This angle ABC is the given angle.

Now draw DE a horizontal line 2½ inches long, and let D, the left-hand extremity, be the vortex of the angle to be constructed. With B as a centre for any convenient radius, say about 1½ inches, describe the arc FG, cutting both AB and BC. With D as a centre, and the same radius, draw the indefinite arc HJ. Now set the compass so that the distance equals the chord FG. With H as a centre and a radius equal to FG, draw an arc, cutting HJ at J. Through D and J draw a straight line. The angle JDE will now be equal to the angle ABC.

This completes the plate. Draw all these problems very carefully with a 4 or 6H pencil, making sure that the pencil is good and sharp. Draw your lines lightly, then, after completion, ink them in as shown on the plate. Students will do well to study and memorize these problems if possible. Above all get busy with this plate and send us along your work for inspection. Have you landed one of those scales yet? If not, this may be your lucky plate.

Tear off and send with drawing

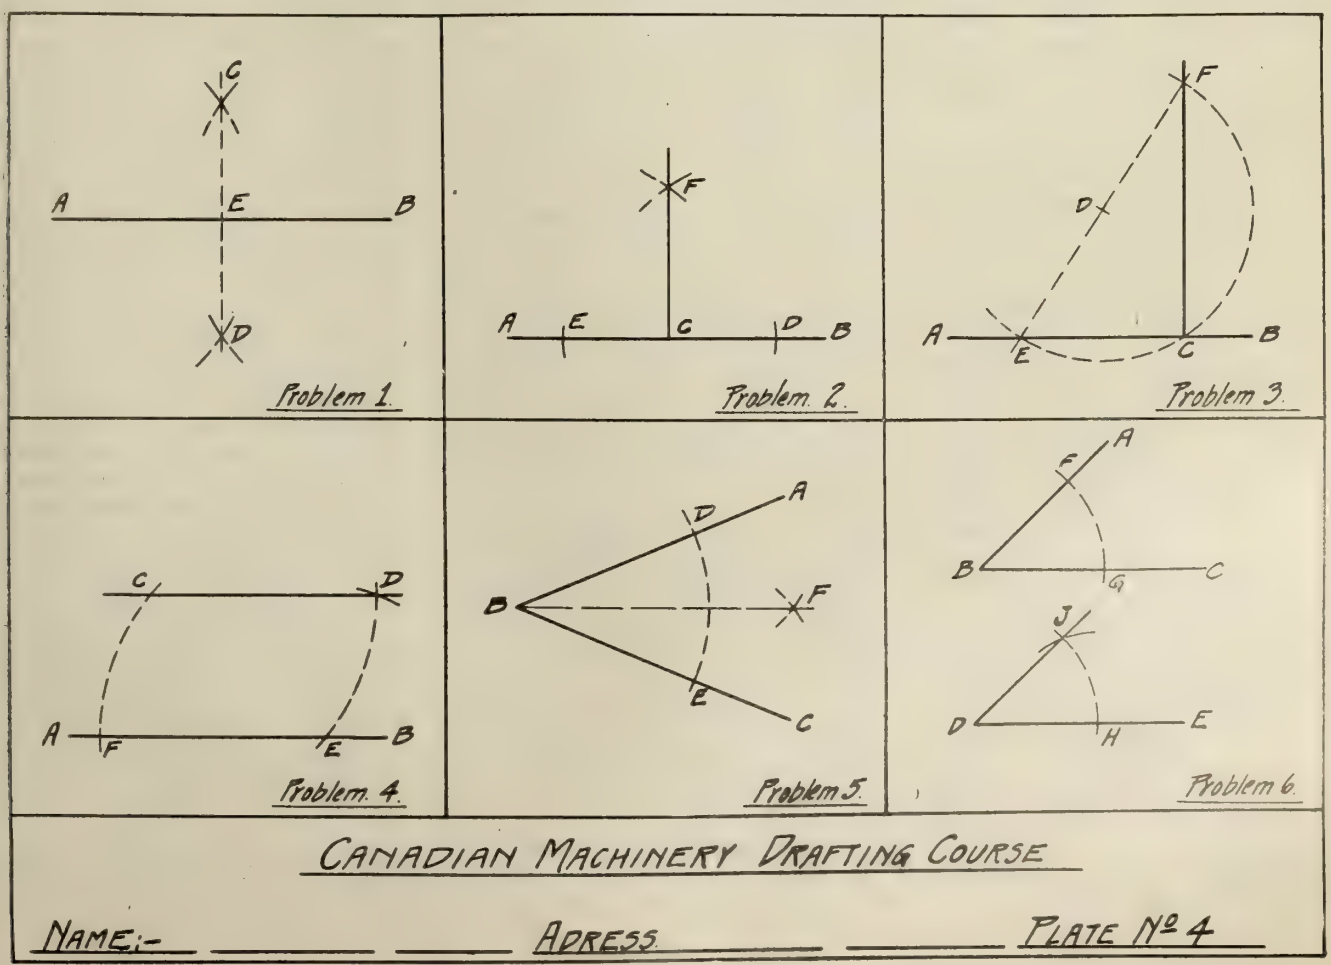
Firm's name.....

Arsenical poisoning by coal and coal products was recently discussed before the French Academy of Science by Charles Richet in a paper. There had been an outbreak of serious symptoms at a briquette works. The name given to the disorder was the pitch disease. In many cases there was cutaneous cancer of a grave form, which even proved fatal; about 30% of all the employees were affected in this way. A chemical analysis was made of the pitch, and arsenic was clearly found in it, and traces were also discovered in the dust at the works, in the hair of the workingmen (and that in considerable quantities) and in the blood of most of them. It was evident, therefore, that they were under the influence of arsenic. It was ascertained that similar results have been met among tar distillers, road asphalters, tarred paper makers, and lampblack makers. The origin of this arsenic is to be sought in the coal. It has been long known that certain varieties of coal contain notable quantities of arsenical pyrites; but it is a new thing to find that arsenic is so widely to be found in coal.



WELDING AND CUTTING

WELDING SCHOOLS, MOTOR TRANSPORT CORPS, U.S. ARMY†

By C. K. Bryce*

UNDER the expanded program of the Army one of the very noticeable shortages in the personnel of the Motor Transport Corps was that of oxy-acetylene welders. Welders were required in the Maintenance Divisions of this corps. In this division were two units that included welders—the Base Repair Shop units and the Machine Shop Truck units.

The Base Repair Shops were large shops of about 250,000 square feet of floor space, in which every operation in the rebuilding or repair of a motor vehicle could be carried on. Naturally, an important department was the welding shop. This was completely equipped with an acetylene generator, blowpipes, regulators and auxiliary devices, in accordance with latest practice. These shops were permanently erected and located in proportion to the motor vehicle requirements of the territory or troops to which they were attached.

The Machine Shop Truck units were essentially small machine shops on wheels. The principal truck had mounted on it a lathe, drill press, grinder and other tools for automobile repair and upkeep. In the equipment was included a complete oxy-acetylene welding and cutting outfit. Attached to the underside of the truck body were two oxygen cylinders and one acetylene cylinder. These mobile shops were used for minor or emergency repairs, which it was not practicable to put through the Base Repair Shops. Each army had a certain number of these units assigned to it.

On surveying the welding talent necessary to fill these units less than 100 welders were available. From the tables of organization it was estimated that between 1,500 and 2,000 would be required in six or eight months' time. The usual channels of draft, induction, enlistment and transfer from other Corps being discontinued, it was apparent a new source must be created.

In May, 1918, after considerable activity on the part of Col. J. W. Furlough, Deputy Chief, Motor Transport Corps, the organization of a welding school was started. This school was divided into three sections, to be located at each of the three Base Repairs Shops, then in process of erection in this country—namely, Camp Holabird, Md.; Camp Jessup, Ga., and Camp Normoyle, Texas.

Each school was laid out to accommodate a class of 100 welders, with provisions to increase this to 150. The buildings consisted of a school building proper, and an oxygen and acetylene house. The main building was divided into a welding room, lecture room, offices, stockroom, and repair shop.

The welding room consisted of rows of stations, piped with oxygen and acetylene from a central source. Each station occupied 7½ x 6½ feet of floor space, and consisted of a cast iron welding table, blowpipe, oxygen and acetylene regulators, hose, etc. The oxygen and acetylene were piped in headers between the rows of tables. Oxygen was distributed from a 30-cylinder manifold; acetylene was generated in a non-automatic generator at low pressure, and delivered to a 1,000-cu. ft. gas holder; from there it was compressed in a single stage compressor to about 10 lbs. pressure. After passing through suitable regulating and relieving devices the gas entered the station headers.

The course of training was from six to eight weeks' duration. The actual welding time averaged about 60 hours. In addition to this, there were about 30 hours of lectures and talks. A course of 60 standard problems, selected to cover the motor truck welding field, was selected. These problems covered steel, cast iron, malleable iron, aluminum, brass, bronze, copper, brazing and lead burning.

The students were compelled to perform each problem satisfactorily before progressing to the next. Every morning he was given a short talk on technical factors involved. On Saturday morning he was questioned on the week's work.

The training progressed by weekly grading, which allowed a flexible and continuous scheme of instruction. At the beginning of each week a green squad of from ten to fourteen men entered the school. At the end of each week a finished squad was graduated. The new men would be taken in charge by the instructor supervising the first week's training. At the end of this time, provided their work was satisfactory, they would be advanced to the next grade under the instructor in charge of the second week's training.

This arrangement proved satisfactory, since it was possible for a student to advance more rapidly than his squad should his skill warrant it, or in case he were backward, to progress at a slower rate. Also, another important feature which had to be considered was that of instructors. In this scheme the instructors were specialized on a limited section of the training only. They could, therefore, be developed faster and more efficiently than if they were given a more or less general training for the entire course.

After a student had completed a problem, it was inspected by the instructor, and where required, the weld broken and the fracture examined. The student was graded accordingly. These grades were recorded and averaged with the grades given in the lecture room. If, at the end of four weeks, a student who had entered as a private was above a certain average, he was recommended for promotion to Private, First Class. During the last week of the training the student was placed on practical jobs without any assistance from the instructors. This was in order that he attain confidence in his own ability to overcome difficulties that might confront him.

When he had satisfactorily completed his practical work he was given a written quizz, to refresh his mind on essential points. He was then awarded a certificate and relieved from the welding school detail, and held ready for assignment to duty. In active service the Motor Transport Corps graded the welders from Sergeants, senior grade, to Corporals, the average grade being Sergeant. The Sergeants, senior grade, were foreman welders connected with the welding department of the Base Repair Shops. The Corporals were helpers.

At the time of the signing of the Armistice only one of the three schools was in full operation. Due to delays in building appropriations the other school buildings were just being started. These were finally abandoned.

The Camp Holabird school, which was in operation, was housed in a three-storey distillery building already erected

†Paper read before International Acetylene Association, New York.

*Formerly Major M.T.C., U.S.A.

and because of this had several months' start on the others.

It was shown, in this method of training, that the difficulty connected with the production of welders was more or less imaginary. Of the men received—and these were not selected because of any particular qualifications — there were only about 8 per cent. rejections. In practically all cases this was due to disinclination rather than inability to absorb the training.

In proportioning the course, 3½ weeks were spent on steel 2 weeks on cast iron, 1 week on aluminum and the remainder on miscellaneous metals. Steel being the first metal tackled by the student, more time was spent on this, in order that he thoroughly master the fundamentals. Aluminum welding was grasped quite readily, as was also cast iron.

The welding school has become a permanent institution in the Motor Transport Corps. Originally conceived for emergency training it now fits in nicely with the educational plans that have been adopted for peace-time service. Recruits are given the opportunity of learning one or more of the trades connected with motor truck operation and maintenance. Oxy-acetylene welding has met with its share of popularity and it is believed that the school will be filled to its capacity at all times.

Worth-While Information From Many Points

A very effective agent for moisture-proofing wood has been found in an aluminum leaf coating. This coating practically insulates the wood against any change in atmospheric conditions, and is particularly valuable for use where accurate form and balance must be maintained, as would be necessary in an airplane propeller.

* * *

A statement issued by the British War Office gives the following interesting data regarding the comparative number of bombs dropped by aviators on both sides during a single month. In the area occupied by British troops in France during that period German aviators dropped 1,482 bombs, while British airmen let loose 7,653 bombs into German-occupied areas in the same month.

It is not generally known that the American Federal Board for Vocational Education maintains a course designed to prepare disabled soldiers for civil service positions. There are 32 men now studying to qualify themselves for positions under the civil service, and the Board will undertake to prepare any student who so desires, provided he can qualify as physically competent to do the work. Of course there are some regulations regarding these positions and men obviously handicapped cannot expect to hold down jobs where their physical disqualifications are such as to prevent the proper discharge of the duties. But on April 16 the President authorized an amendment to the civil service rules which permits the civil service commission to exempt from the physical requirements established for any position, a disabled and honorably discharged soldier or sailor or marine upon the certification of the Federal Board for Vocational Education that he has been specially trained for and has passed a practical test, demonstrating his physical ability to perform the work sought. Under the law a disabled soldier has a preference on the civil service list.

Mariners who frequent the coast of Peru are familiar with a curious phenomenon that occasionally prevails there —notably in the harbor of Calloa—commonly known as the "painter." The water becomes discolored and emits a nauseous smell, apparently due to sulphuretted hydrogen. The white paint of vessels becomes coated with a chocolate-colored slime; especially when the wet fog, known as the garua, prevails at the time. Presumably both the discoloration and the smell are due to the decomposition of marine organisms. In a paper recently presented to the Geographical Society of Lima, Senor J. A. de Lavalle y Garcia discusses this phenomenon (which he calls "aguaje") and concludes that the primary cause is the seasonal shift of ocean currents. The "painter" prevails during the months December to April, at which time the warm equatorial countercurrent displaces the cool Peruvian current. The resulting change in temperature of the ocean water would, he thinks, kill quantities of plankton, and the decay of this organic matter would give rise to the phenomena observed.

* * *

The inactivity of the Russian platinum mines has caused a corresponding increase in activity in Colombia. A large company has recently been formed to operate in Colombia, which is reported to hold 10,000 acres of land as well as 50 miles of river bottom. The operations of this company should materially increase the output of platinum from Colombia. It is announced that the War Department, through the Chief of Division of Sales of Munitions will dispose of 19,000 ounces of platinum at a minimum cost of $105 an ounce. A substitute for platinum in electrical apparatus has been the object of some private investigations. One satisfactory substitute for cathodes was found to be 90 per cent. gold and 10 per cent. copper.

* * *

According to an article in the London "Times" of recent date, the manufacture of laboratory glass started at Sheffield since the war has made substantial progress, though much remains to be done if the industry is to be commercially sound and able to compete in the world's markets. Prior to the war there was no manufacture of laboratory glass in Great Britain, and the whole process, hitherto confined to Germany, had to be discovered and workers specially trained. With this object, a department of glass technology was opened at Sheffield University with the support of the Government, and to-day the department is turning out work said to equal anything Germany ever produced. The experimental nature of the work has made the cost of production heavier than the German article, and to help this a glass research association is being formed. The British Government has been asked to provide $364,987 over a period of five years, and the manufacturers will contribute a further sum of $121,662. It is said that the first attention of the association will be directed to problems of machinery and labor-saving devices.

THE FUNDAMENTAL PRINCIPLES

Continued from page 411

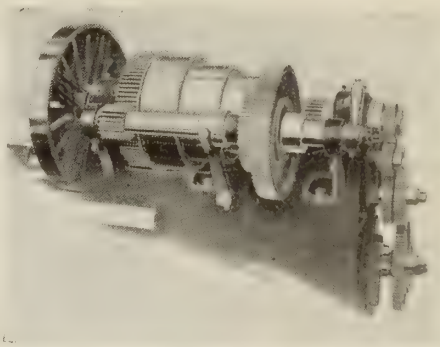
ing the hazard. Gate guards and two-handed operations are sometimes necessary, but should be used only as a last resort. The methods above are more efficient because they go to the root of the matter and remove the hazard, rather than merely guarding it. When you remove the hazard you simplify the operation and therefore increase production. When you merely guard the hazard you may decrease production.

What I have said of the punch press is typical of many machines. Safety engineering does not consist in simply building wire mesh guards, nor in buying safety devices which look pretty in a catalogue, and putting them on the machine without regard to the wishes, the convenience, or the efficiency of the operator. The real safety engineer will, where necessary, study the operation of a machine until he understands it as well or better than the operator himself —as well as the foreman, the superintendent, the master mechanic; and then he will apply their brains and his own in working out either a guard, or a change in the machine, or a change in the operation, which will remove the underlying hazard and make the operation intrinsically safe.

DEVELOPMENTS IN SHOP EQUIPMENT

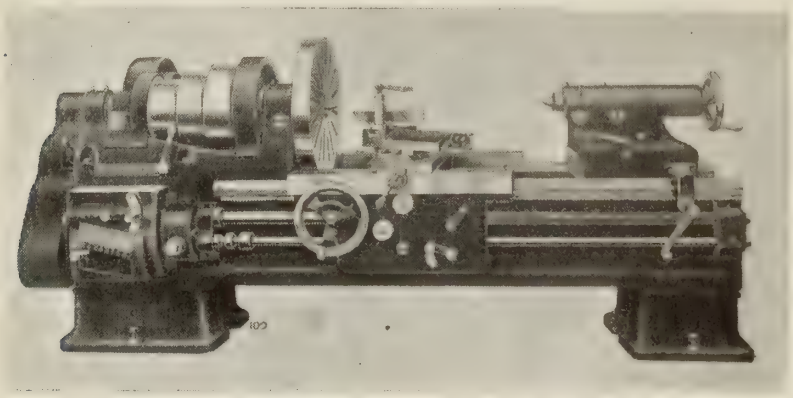
CINCINNATI 28-INCH SEVERE-DUTY LATHE

In Fig. 1 is shown a general view of the 28-in. "severe duty" lathe built by the Cincinnati Lathe and Tool Co., Cincinnati, Ohio. This machine is a larger edition of the 15- and 16-in. lathes manufactured by the same company for the last 15 years and includes the same features. Designed for heavy duty, the construction is neither complicated nor such as to make the parts cumbersome to handle. Fig. 2 shows the sliding double back gears from the rear.



SLIDING DOUBLE BACK GEARS AS SEEN FROM REAR.

The bed is 18¼ in. in depth and 23⅛ in. wide and is heavily braced with box-section girders to minimize twisting strains. Bed lengths from 10 to 30 ft. can be supplied, each size being 2 ft. longer than the preceding one. The cabinet legs are provided with two screws in the centre of each so that each end may be regulated to make the bed perfectly true. This arrangement makes wedges unnecessary.



Front bearing, 4½ in. x 7¾ in.; back bearing, 3⅜ in. x 5⅜ in.; width of belt, 5½ in.; hole through spindle, 2⅛ in., cutting tool size, ⅞ in. x 1¾ in.; diameter nose of spindle, 4 in.; diameter of tailstock spindle, 3⅜ in.; length of carriage bearing on bed, 36 in.; ratio of back gears, 12¼ and 3 3-5 to 1; diameter of countershaft pulleys, 16 in. x 5½ in.; speed of countershaft, 185 to 225 r.p.m.; lengths of bed, 10 ft. to 30 ft.; distance between centers, 10-ft. bed, 60 in.; weight (net) 10-ft. lathe, 7,100 lb.; weight per extra 2 ft., 520 lbs.

The equipment supplied with the lathe includes the cabinet legs, a box-type apron, a chasing dial, an automatic stop, plain or compound rest, large and small faceplates, a steadyrest, a self-oiling two-speed friction pulley countershaft, a quick-change gear box giving a wide range of threads and feeds and the necessary wrenches.

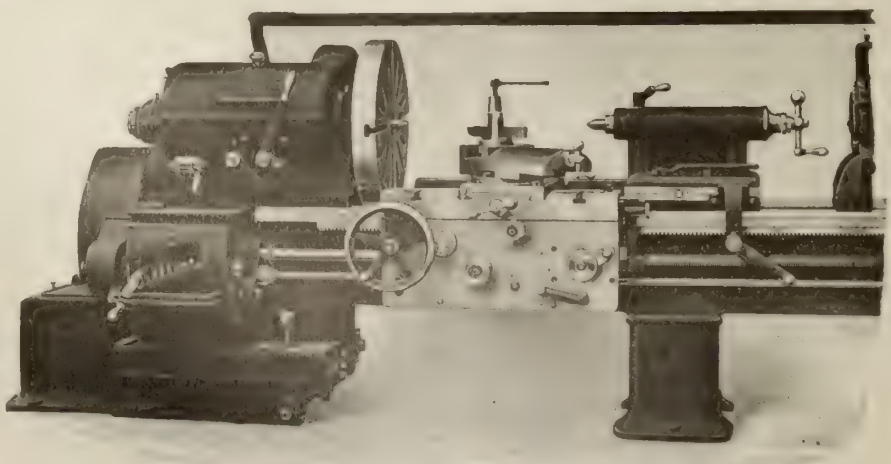
The following extra equipment can be furnished: turrets on carriage or bed, oil pan and pump, taper, relieving and draw-in attachments, chucks, etc. This machine may also be obtained with geared head for belt or motor drive.

Above are the principal specifications.

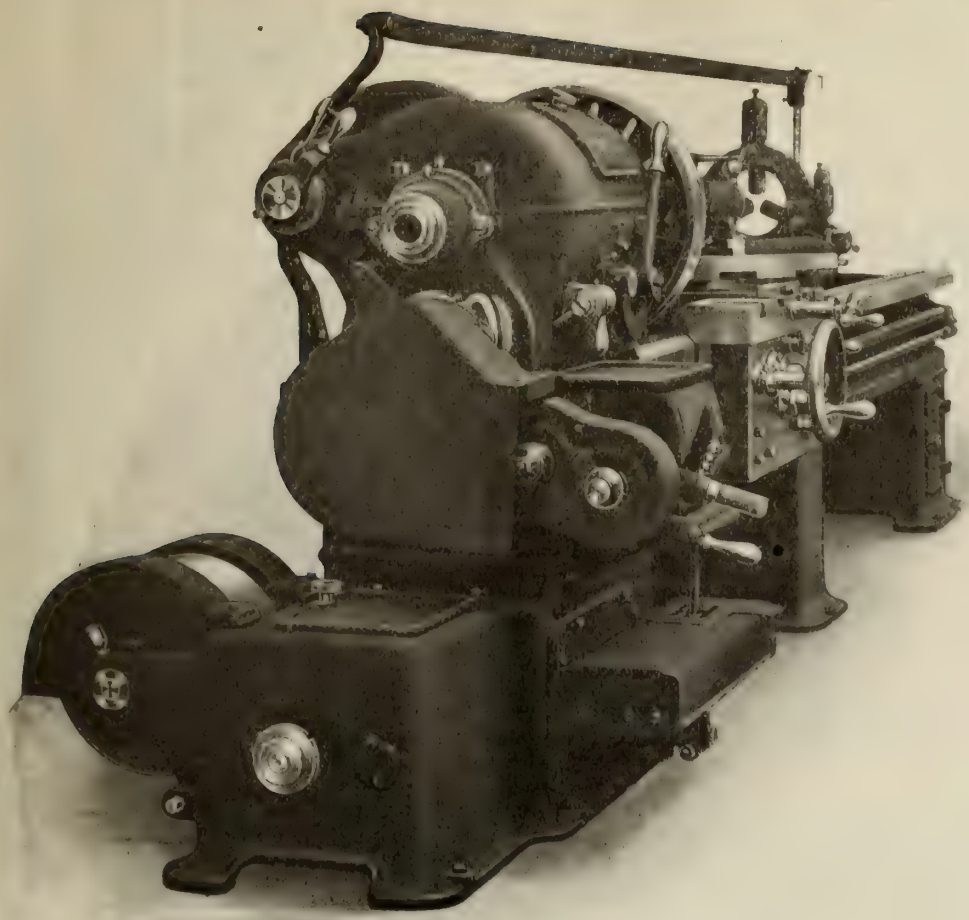
BRADFORD GEARED-HEAD LATHES

The Bradford Machine Tool Co., Eighth and Evans Sts., Cincinnati, Ohio, is now building a line of geared-head lathes in sizes ranging from 14 to 32 inches, inclusive. These machines may be equipped with either an individual electric motor drive or a single-pulley drive, according to the requirements of the purchaser. It will be apparent to those who are familiar with the cone pulley driven lathes of this company's manufacture, that the design of the new machine is essentially the same, with the exception of the driving arrangement. The dimensions of the cone-head or geared-head lathes are also the same, except that the available distance between centres is usually greater for machines with the geared head.

A feature of the new type of Bradford lathe equipped with an individual motor drive is the low mounting of the motor. The driving mechanism is placed beneath the bed and operates through a selective-speed gear-box which transmits power up to the spindle. Attention is called to the fact that the single-pulley drive for lathes of this type is interchangeable with the motor drive, and is similarly featured by the low mounting of the driving pulley. A machine so equipped requires only a single fixed pulley on the lineshaft, or a suitably located short shaft which is driven from the lineshaft, it being unnecessary to use a friction clutch operated countershaft. A selective-speed gear-box similar to that used with motor-driven lathes, is employed in the case of machines equipped with single-pulley drives. These machines can be installed



GENERAL VIEW OF THE LATHE.

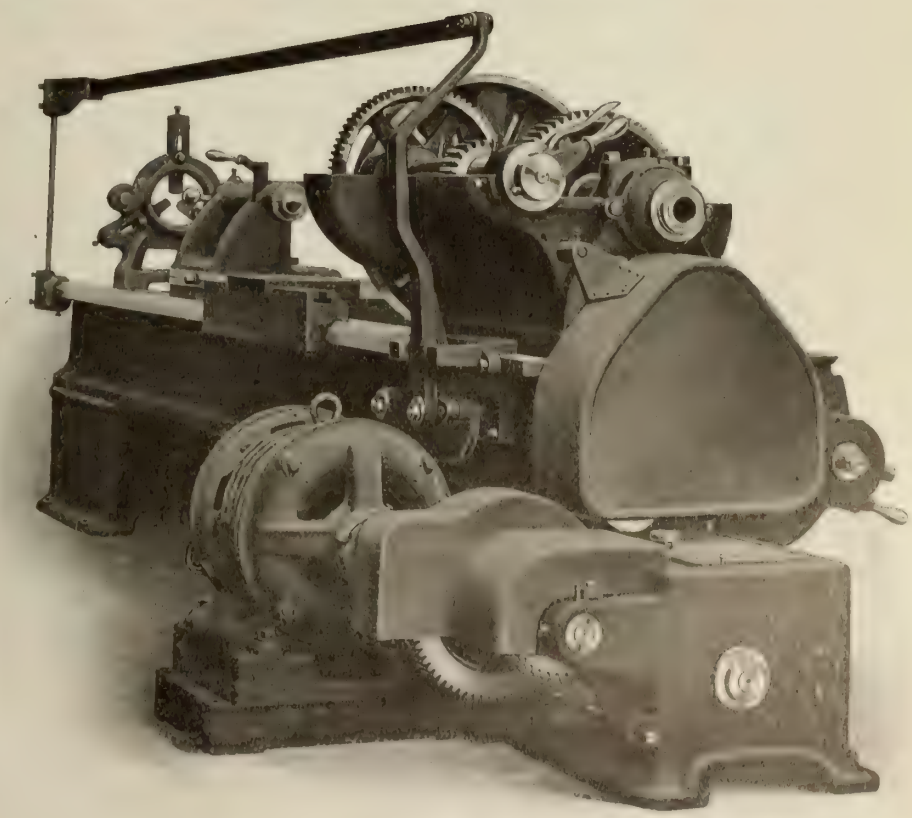


BRADFORD GEARED HEAD LATHE, PULLEY DRIVE.

with either independent or group motor drive. In cases where a group drive is employed, a single motor-driven overhead shaft is used to carry the driving pulleys.

Regardless of whether these lathes are equipped with an individual motor drive or a single-pulley drive, the means furnished for the transmission of power is essentially the same. It consists of an arrangement of driving shafts and gears, as illustrated in Fig. 3. Six gears on shaft A afford six independent driving speeds for shaft B, which through intermediate shafts C and D, and the connecting chain E drives the lathe spindle. The drive is direct when clutch F engages gear G or power is transmitted through a back-gear shaft H when the positive clutch I engages gear J. Twelve spindle speeds are thus obtained, and corresponding reverse spindle speeds are obtained when the lower clutch K engages the chain drive L, automatically disengaging the clutch and driving gear M used for the forward drive. The operating arrangement on this machine includes an ordinary pole and speed-box lever that are in such operative connection with each other that gear shifts in the speed-box cannot be made unless the initial driving power clutch is moved by the shifter pole to its central, or disengaged, position. By this arrangement, which is effective through an interlocking device, no abuse of mating gears in the speed-box is possible because they can only be engaged after the driving power is disengaged by the shifter pole.

Mechanical speeds through the speed-box are selective and instantly obtained by sequential movements of the shifter pole and speed-box lever. Provision is made for starting, stopping, or reversing the lathe by means of the shifter pole.



BRADFORD GEARED HEAD LATHE WITH INDIVIDUAL MOTOR DRIVE.

BOWSER OIL STORAGE SYSTEMS

The S. F. Bowser Company, Ltd., Toronto, Ontario, Canada, have issued a very interesting little booklet entitled "How Bowser equipment saves oil, time, money. In this they state various points of interest and value to those in need of such equipment, and readers interested can procure a copy by writing for the same.

The Chain Products Co., of Cleveland, Ohio, have issued a very attractive and useful catalogue, which is especially useful to anyone interested in chain products of any nature.

This book, known as their catalogue 330, consists of 111 pages, and is divided into three sections. The first is devoted to coil chain, the second to chain specialties, and the third to miscellaneous attachments. Several wire and chain tables form a closing part of this book, which should be in the hands of those interested in weldless chain.

Ontario Votes to Stay Dry

AT this writing it becomes increasingly apparent that booze has been voted out of Ontario. The ballot was rather a confused affair, for either wets or drys, but that did not keep the people of this good province from coming out with a death wallop to the most damnable traffic it ever housed.

When they were at it they should have hit harder.

John Barleycorn used to hit hard. He never showed quarter. When his man showed signs of going under he never quit.

John Barleycorn stayed with his victim until his health, his home, his money, his all was gone. It left him only when the undertaker came along to clean up the mess.

The liquor traffic is not entitled to sympathy. It gave none and should expect none.

The next move should be to have prohibition for those who have a private grog shop in their cellars.

The little chap who had only ten cents or a quarter to spend at the bar has had his schooling, his feelings have been hurt and his long dry thirst has not been cured except as he takes it to the tap.

The man who was afraid to face the drought, and who stocked his cellar, was not big enough to take his trimming along with the little chap who used to pound the brass rail at the corner hotel.

He has still to learn what it means to curb an appetite or control a passion. It is up to him, if he wants to demonstrate that he is as good a citizen and law-keeper as the little fellow, to come across and keep the spirit of the law rather than to glory in the ability of the secrecy of his cellar to defy and break the real meaning and purpose of prohibitory legislation.

Industrial Ontario has done well. She now faces an era of sobriety and development. She will never live to regret the vote she gave on October 20th.

SPEAKING of wages, one writer pauses to remark that the laborer feels worthy of his "higher."

Why Not Talk Plain English?

ON the 25th of September the Ontario Government desired to inform the people that an election was going to be held. Not much of a trick to do this. The people would hear of it quickly through the papers, but it must be officially said so in the Ontario *Gazette*.

Never heard of the Ontario *Gazette*?

Well, that's not strange. But let's get back to this question of holding an election. The people must be told that the present House is through, that nominations and elections were coming, one on the 13th and other on the 20th. Nothing much in that—but hold!

The chant runs thusly in an extra edition of the aforesaid and unknown *Gazette*:—

PROCLAMATION.

John S. Hendrie.

Canada.

Province of Ontario.

George the Fifth by the Grace of God of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas, King, Defender of the Faith, Emperor of India.

To all to whom these presents shall come or to whom the same may concern:— Greetings:

W. H. Hearst,
For Attorney-General,

Proclamation.

Whereas we have thought fit, with the advice and consent of the Executive Council of our Province of Ontario, to dissolve the present Legislative Assembly, and to forthwith call a new Legislative Assembly;

Now know ye that we do hereby make known Our Royal will and pleasure to dissolve the present Legislative Assembly, and to call a new Legislative Assembly of our said province, and we do further declare that by the advice of our said Executive Council we have this day given orders for issuing our writs in due form for calling a new Legislative Assembly of our said province as aforesaid, the said writs to bear date the twenty-third day of September, A.D. 1919, and to be returnable forthwith after the execution thereof.

". . . Of all which premises all our loving subjects and all others whom it doth or may in anywise concern are hereby required to take notice and govern themselves accordingly.

"In testimony whereof we have caused these our Letters to be made Patent and the Great Seal of our Province of Ontario to be hereunto affixed.

"Witness:—

"His Honor Sir John Strathearn Hendrie, Knight Commander of Our Most Distinguished Order of St. Michael and St. George, Commander of our Royal Victorian Order, a Colonel in Our Militia of Canada, etc., etc., Lieutenant-Governor of our Province of Ontario, at our Government House, in Our City of Toronto, in our Said Province, the twenty-third day of September, in the year of our Lord, 1919, and in the tenth year of Our Reign."

Why not put the pruning hook into about 90 per cent. of that junk? All that is necessary is to state that nominations are on the 13th and elections on the 20th.

It is not necessary to drag all the other individuals and organizations and orders and whereases into the case at all.

The Ontario *Gazette* is due for a shave and a hair-cut all at the one sitting.

CANADA is soon going to have 20,000 miles of Government-owned and operated railroads. This is a much greater mileage than the Government is now muddling with. But—the greater the mileage the greater the muddle.

* * *

A CAMPAIGN to stop smoking makes no headway. It's impossible to control the crop of tobacco, cabbages, mullin leaves, cedar bark, smoking cane and whip handles.

* * *

THERE'S many a four-flusher discussing with his friends the location of the Rolls-Royce plant in America, and at the same time reading the sale ads. for a mussed-up flivver.

State of Mind of the Foreigner in this Land

SOME of the members of the committee investigating conditions in the steel mills of United States seemed to be surprised that they should find notices to the foreign employees printed in five different languages.

The surprise should not have been at such a thing, but at the members of the committee, public men, supposedly in touch with what is happening in their country, being ignorant of this condition.

This particular condition is not exclusively the property of the United States. Its duplicate can be found in several lines in Canada.

For years it has been a hard matter to call attention to the real foreign problem. When it was brought up by labor interests the cry was raised that labor wanted to shut them out to keep the price of labor at a higher mark. And it might be added right here that if the only aim of bringing foreigners to this country is to bring them here to compete with our own labor, and force down the standard of living, then the time is ripe to slam the national front door in a mighty emphatic manner.

On this page we show a reproduction of a picture that was found in several places in the homes of foreigners employed in the U. S. steel mills. It is the conception that some of the foreigners have of the way they are being treated and exploited under the capitalist system.

Look at the thing, and then imagine the state of mind of the ignorant foreigner who has been brought up in such an atmosphere.

Look at the thing and you can see there the passions and the hatred that the agitator calls into play when he wants to sand-bag industrial life on this continent.

For the purpose of this article, CANADIAN MACHINERY eliminates the international boundary between Canada and United States, for the very good reason that their problems in dealing with the foreigner are our problems. The history of the strikes of 1919 prove that beyond the chance of successful contradiction.

The talk of Americanization and Canadianization in relation to these people is folly unless we are prepared to realize that they can make or break our national happiness and prosperity.

On election day in Toronto, in the foreign districts, one could see these men in hundreds after hundreds, pouring into the polling booths, voting on what manner of laws we shall have in this land.

Do they fully understand the things about which they vote?

They do not.

Have they any good idea of what the things they vote for mean to the land?

None at all.

Do they understand or appreciate what a prohibitory law has worked for Ontario in the way of the reduction of crime, and the increased bank deposits of hundreds of people?

No, they do not. Nor do they care a whit. They were out, every man jack of them, voting for the repeal of the O.T.A.

The skilful politician makes all sorts of appeals to their fancies and their prejudices, and their votes are counted to kill the expression of opinion of men and women whose every interest is tied up in the development of this Canada of ours.

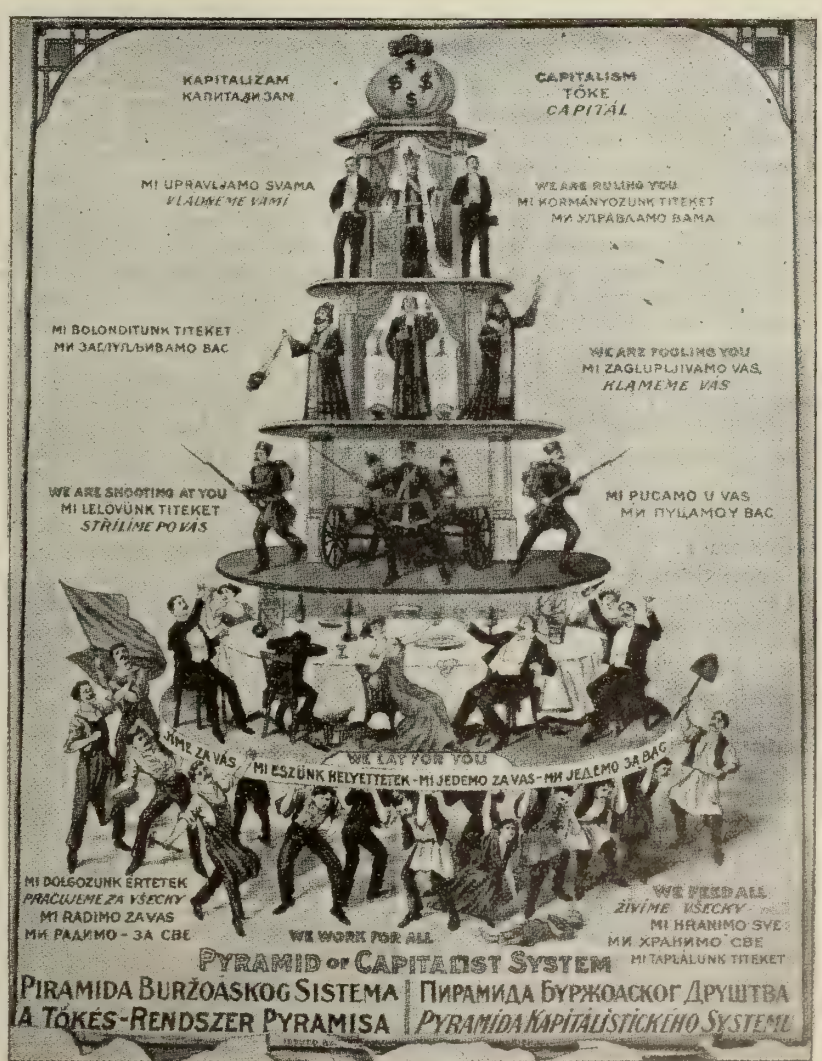
But to return to the picture on this page. Is it possible to make a good Canadian or a good American out of a man who is cherishing the thought that the system of Government, the church, the militia are all framed and brought into existence for the sole purpose of becoming a millstone around his neck, to grind him down and to keep him down?

The only answer to such a query is a plain and emphatic NO!

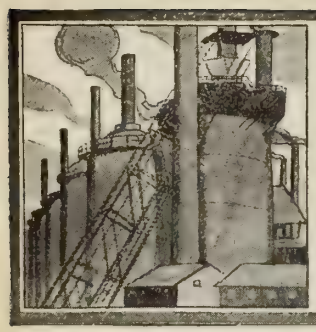
The man who has this picture burned into his mind will look upon almost every move that is made for his betterment as a move on the part of the capitalist class to further draw the cord around him. He cannot be approached as a man with an open mind. The agitator keeps this picture before him. He has been doing it for years in Canada and he has been doing it for years in United Sates. And all the while he has been more or less unmolested in his damnable occupation.

That same doctrine has been shouted up and down the coal mining areas of Western Canada for years. Men from the Old Country — not foreigners — have been the leaders in the movement in many cases. It has

(Cont. on page 56)



HOW THE AGITATOR WORKS ON THE FOREIGN MIND



MARKET DEVELOPMENTS

Automobile Business Buys Many Machine Tools

This Industry is Probably Leading All Others in Being a Consistent Customer—Motors Are a Month to Six Weeks Off in Delivery—Scrap Buying Better in Canada

THE "A" industries are still doing the bulk of the buying as far as machine tools and supplies generally are concerned. In this case the "A" industries take in the automobile and agricultural shops. There must be a very large market for cars in this country now, and prospects of tremendous sales in the spring, as the matter of selling takes very secondary consideration to the problem of production now. Plants that have been in existence only a short time are already planning to what extent they will build their extensions, and all this means that there will be a big market for tools and supplies.

The steel strike in United States has had the effect of slowing down the deliveries of material to this country, until at present it can be estimated as about thirty-five per cent. of normal, and slower in proportion. In some cases, though, material comes through well, as one of the shipbuilding concerns got a nice tonnage of plate across that only went to the mills in the middle of September. But the recovery of production at the mills themselves is slow, and business is piling up at the mills, although it must be said that the trade in general is giving every leniency to the mills in the matter of deliveries.

The general development that is taking place all over the country is reflected in many ways. For instance, the sale of motors—small sizes, from one to thirty horsepower—is very brisk, the demand coming from small shops all over the country in a diversified line of business. Deliveries used to be made almost at once out of stock for any of these motors, but now it is a matter of four to six weeks before deliveries can be made. In used motors, attention should again be drawn to the advisability of care in buying these. The best plan is to get them, if necessary at all, through a reliable dealer, or else to have an expert of the customer's choosing look over the proposition.

The scrap metal market shows some firmness, buying for domestic causes being better, although sales to United States are not being put through now. Prices are strong in some lines, especially heavy melting steel, and prices may be marked up a little later on.

BETTER CONDITIONS ARE EVIDENT IN THE SHIPPING CIRCLES AT MONTREAL

Special to CANADIAN MACHINERY.

MONTREAL, Que., Oct. 23.—The settlement of the English strike has been reflected here in the better conditions that are evident in and about the harbor. Congestion of freight is less pronounced and arrivals and sailings are more regular, although some time must elapse before things are again normal. During the past week or so lake boats loaded with grain have been laid up in port for some time before they could discharge their cargoes, as no ocean boats were on hand to take the grain from the elevators that have often been filled to capacity. Relief is now in sight and it is being felt in general business throughout the district. Many American concerns are locating branch factories in the district, and some Canadian enterprises are being developed, all of which will add to the coming season's activities.

Strike Has Little Effect Here

The experience of dealers and consumers seems to be that little difficulty has arisen as a consequence of the disturbances in the American steel districts. At times the shipment of material has been somewhat delayed and has resulted in temporary inconvenience, but on the whole the industrial activities, that are dependent on steel commodities, have not suffered very heavily by the steel strike in the States. One large dealer states that they are receiving regular shipments of material from the Carnegie plants at Pittsburgh, and with few exceptions the material has been delivered on schedule time. It might be mentioned, however, that the present demands are only normal, and it is generally believed that mill supplies are still ample for current needs, and that steel production, in the aggregate, is little below what it was when the strike became effective. Existing demands have not been pressing, and in most instances, dealers have been able to supply all the needs of the trade, unless the inquiry is for special shapes or sizes, and while some trouble has been experienced in getting these through promptly, they invariably come to hand after a short delay.

Canadian mills are quite busy, and where the product is similar to American mills affected by the strike, the volume of business has shown a fair increase. Dealers here believe that price quotations will continue firm for some time, but would not be surprised to see advances when conditions are more settled. While it is difficult to get accurate record of conditions as they exist in the affected steel centres in the States, it is believed that production is much lower than before the strike, but it is anticipated that a steady improvement will be shown from now on, as many of the mills are gradually resuming normal operations. Some districts are about back to capacity and others are slowly progressing.

Metals Generally Firm

The metal situation has been quite active during the past week, and the demand in general has been good, particularly in lead, the sales in this metal

having been above normal. Copper is moving freely but has been somewhat affected by the steel strike as the demand has fallen off. As a result the market is weaker and prices have declined ½ cent per pound. Quotations on the market here are 25 cents for lake and 24½ cents for electro and castings. Tin is steady but slightly easier, the quotation of 58 cents being a decline of 1 cent per pound. Spelter is ½ cent stronger at 10 cents per pound. Lead is active on an advance of ½ cent, the price quoted being 7¾ cents per pound. Antimony has also improved, the price asked being 10 cents, an advance of ¼ cent per pound.

Gradual Increased Tool Demand

Reports from dealers on machine tool activity would indicate that the volume of business passing is comparatively steady and quite normal. Some report very good business, while others report a quiet week, but the general impression is one of steady increase. Large single sales are not the order of the day, although some good business has been done in this respect. The bulk of the present demand is well distributed, and when the total is compiled the relative turnover compares favorably with prewar business. An encouraging factor at the present time is in the inquiries that are coming in from agents here, who are looking over the ground with a view of establishing branches of American industries. Two of these enterprises are associated with railroad requirements, and machine tool dealers here have had inquiries regarding the necessary equipment; some good business is anticipated. The volume of supply business seems to be good, and dealers are apparently satisfied with the present demand, and while it may not be up to war requirements, it compares favorably with the demand of 1914. Some difficulty has developed in obtaining delivery of tools and supplies, and this condition is frequently felt by manufacturers, as the gradual freeing of the market of used equipment makes it harder to secure tools of this character. This feature of present activities sends a note of encouragement through the trade as it was fully expected that second-hand tools would become a drug on the market. A firm making air compressors says that the better inquiry for new machines is a result of the absorption of the greater number of the used tools, which, for a time after the war, were quite plentiful.

Quiet Business in Scrap

There is not sufficient offering in the scrap market to create any special interest at the present time. There is very little scrap of any kind going into the States, as the curtailment of the production, as a result of the strike in the steel mills, has affected the situation here. One American dealer has sent out notices to the Canadian trade that he is in the market for considerable quantities of machine shop turnings, but the price offered (f.o.b. delivery point) is little inducement to local dealers, as it is much lower than that which the material should demand, with freight, etc., added to the prevailing quotation here. The local demand for this class of scrap is almost equal to the supply, so that dealers would not be interested unless the American consideration was worth while. There is a steady demand for machine cast iron, but the volume is seldom large as consumers are content to operate on the basis of present requirements. The general listless character of the market has dulled the interest of the dealer, and he, like the trade, is calmly waiting further developments. Quotations are unchanged with a weak tendency.

POINTS IN WEEK'S MARKETING NOTES

Deliveries of material from the strike zone in United States are coming through rather slowly. A fair tonnage of plates and skelp arrived at the first of the week.

—

Canadian mills and foundries are buying fairly large quantities of scrap just now, and there is somewhat of a shortage in heavy melting steel.

—

A revision of classes for the purpose of simplicity has been made in the lists of carbon cutters, reamers and drills, and the discounts announced show a slight increase in prices.

—

There is a brisk demand for motors just now, especially in the smaller sizes, from one to thirty horsepower. Delivery of most of these is now from four to six weeks.

—

Makers of some of the better lines of machine tools have sent out word that they are now sold out until next May.

—

Although more men are returning to work in the steel mills of United States, production is increasing very slowly, and some of the mills are still operating at a very low percentage of their normal capacity.

MATERIAL SLOW IN GETTING ACROSS LINE

But Industries Not Suffering Much Yet From the Steel Strike in United States

TORONTO.—Conditions in the machinery lines seem to differ just now according to location. In some sections there is a good demand for some lines, while in other places the same lines are away off. But for all that, there is a nice line of business moving, although the distance between orders and delivery schedule is becoming greater and greater. Nearly all the business now is for delivery well on into 1920.

The Machinery Business

There seems to be a big market opening up for machine tools in Canada. There are firms that have not closed big business recently, but they are willing to admit that the situation is good. There seems to be a revival of the small shop all over Ontario. By this we do not necessarily mean the small machine shop, but the small shop in many lines, such as wood working of various kinds, building contractors, etc. This is reflected in the sale of motors, and there is something very closely akin to a shortage of the small motor at the moment. As a general thing motors are to be had on very short notice from either the makers or the jobbers, but such is not the case now. The best that can be done in the way of deliveries now is from three to six weeks.

According to information reaching CANADIAN MACHINERY, there have been several sales of used motors put through recently that have not given satisfactory service. It has been pointed out in these columns before, and it should be repeated: Do not buy motors unless you know what you are getting. If you get a used motor, get it through a responsible machinery dealer who will stand behind it, or have some of your own men who understand motors, to go over it.

As mentioned above, it is the small shop that is buying motors in Ontario now. These places did not go ahead during the war. They were tied up in many ways, and are now getting under way again. Where they are buying motors it goes without saying that they will be buying other things, so it all means more business for the machinery dealers.

The lumbering business is going to be better in the next few months than for some time past, from the standpoint of the men who sell machinery and supplies to the mills. There is a very heavy demand in British Columbia for lumber for export, and for many of the markets in United States. There is not a very large amount of B. C. lumber reaching the prairies just now. The export business is nicer to handle and seems to have the call on the available supply.

The automobile business continues to buy a lot of equipment. There is undoubtedly a very good market for automobiles in this country at the present moment, particularly for the medium priced car. The official of one of the large Canadian companies informed this paper only a few days ago that selling cars just now hardly entered into the question at all. It was purely a matter of production.

The agricultural implement places are also doing a fair amount of general buying.

The Effect of the Strike

The shipments of steel and iron from the strike zone are not improving. The strike is still on, and although it is claimed that it is practically lost to the men, it must be admitted that the production of the mills has suffered a very severe

setback, from which it seems hard work to recover. A large importer stated to CANADIAN MACHINERY this week that he would put the amount of material coming through at the present time at about thirty-five per cent. of the normal business, while the delivery dates were also suffering in proportion. Some of the shipyards have received a very fair amount of plate during the last few days, and it is also noted that there have been further shipments of skelp for the tube mills.

Tubes are in demand, but they are coming across poorly. Mills that were counted upon to stand up under strike conditions, are badly crippled, and are not making anything like the progress that was counted upon. One Toronto dealer was informed by a U.S. mill in the strike zone that they were doing little better than ten per cent. capacity, which is far below the rate at which this or any other mill can run and turn out material at overhead prices.

Although some plate has come through in a month from the date of shipment, it is feeling the strike in many quarters. Plate shipments, as a rule, are off by many weeks, although, fortunately, there has been no serious inconvenience so far.

Bars and shapes are not keeping pace with the demands on them. Especially is it true that the demand for shapes, which is a very large class, is away ahead of any possibility of shipment.

Cutting Off the Jobber?

Some of the jobbing houses here state that they have been placed in a position where they get no protection from the makers of Canadian cutters, reamers and drills. That is, the makers will quote a consumer as good a price as he can get from the jobber. Of course, the jobbers are none too well pleased with this arrangement, but it is a fact that it is the same condition that has existed for some time. Prices and discounts have been such as to bring selling figures down to the point where the makers felt that they must have the entire revenue. "Of course, the jobbers," stated one dealer to-day, "will continue to carry the stock, but they will sell as a matter of convenience to their trade."

One of the representatives of the drill makers stated that they had their own men in the principal cities, and they would cover the territory in this way.

There has been a slight increase in the selling price of carbon drills and also in the method of classifying. Formerly there were a large number of prices, but this has been brought down to three as follows:

Half-inch and down.
Half-inch to inch.
Inch and over.

In regard to the discount on these lines, it is now half-inch and down list, plus 20 per cent.; half to one inch, list plus 30 per cent.; over one inch, 35 per cent.

The Scrap Metal Market

The strike situation in United States has for the time being blocked shipments that might otherwise have gone over the border. Dealers on this side have been informed—warned is a better word—that shipments had better be held back, and that if made they will be at the risk of the sender for any costs that may be incurred in non-delivery or acceptance. The Canadian mills and shops are the best customers just now for the scrap yards, and a nice amount of business is moving.

Prices have not been changed at all, although the tendency is certainly for higher values in heavy melting steel. There is not a great deal of this in the country just now. All the scrap shell steel has been disposed of and little else has been coming into the market.

Some of the yards reported that they had received inquiries from New York for copper at 19¼, the first unsolicited inquiry that had come through for weeks.

Apparently some of the U. S. yards have reckoned that Canadian sellers would be unable to sell in their regular places. The Hofmann-Sproul Co., Widener Building, Philadelphia, are offering to take a big tonnage for the next 30 days of machine shop turnings. They offer $14.50 gross ton, f.o.b. cars Norristown, Pa. Dealers here are offering about six or seven dollars for this material, but of course, the freight and other charges must be added, which would bring the figure up around $13 or $13.50.

GREAT QUANTITIES OF USED MACHINES WILL BE PLACED ON U.S. MARKET

Special to CANADIAN MACHINERY.

NEW YORK, Oct. 23.—Business continues at a good rate, the number of inquiries and orders for machine tools keeping up about the same as during recent weeks. Most of the orders placed are for domestic shipment, export trade being rather quiet, due mainly to the continued unfavorable rates of exchange between the United States and European countries.

Among the more important inquiries of the past week is one from the General Electric Co., Schenectady, N.Y., for about 50 miscellaneous tools. The E. W. Bliss Co., Brooklyn, N.Y., continues as a large buyer, most of its requirements being heavy tools.

There has been a good general inquiry. One company has bought a small list of tools for the manufacture of talking machine motors; a linotype company has bought several tools and there are scattered orders and inquiries from industries in many lines.

The United States Aluminum Company of Pittsburgh has let a contract to the Turner Construction Co., New York, for a new factory building at Edgewater, N.J. Six cranes of this plant have been bought from the Morgan Engineering Co., Alliance, Ohio.

Looking For Export

The National Machine Tool Builders' Association held its fall meeting at the Hotel Astor, New York, on Wednesday and Thursday, October 15 and 16. Among the subjects discussed was the advisability of publishing a co-operative export catalogue of machine tools in several languages for world-wide distribution. Committees were appointed to look into the matter and bring in a definite report at the next convention, which will be held at the Hotel Traymore, Atlantic City, N.J., in the spring. A resolution was adopted opposing the adoption of the metric system in the United States. Charles E. Hildreth, general manager of the association, who was appointed by the War Department to assist in planning for the sale of surplus Government stocks of machinery, reported that his task was completed and that $60,000,000 to $70,000,000 of new and used tools will be put on the market within a few weeks. Selling prices have been established, based on the prevailing market prices minus adequate reductions to cover usage and depreciation. The tools will not be sold on sealed proposals, as was at first considered, but will be offered in very much the same way that dealers in second-hand machinery make their sales. Of the surplus about $20,000,000 worth are special machines and the remainder are standard tools.

PRODUCTION IMPROVES, BUT IT IS AT A VERY SLOW RATE IN STEEL MILLS

Special to CANADIAN MACHINERY.

PITTSBURGH, PA., Oct. 23.—The iron and steel strike continues to wane and employment and production at the blast furnaces and steel mills continue to increase, but the rate of change continues to be a very slow one. Production even now is only about 60 per cent. of normal, taking the iron and steel industry as a whole.

When the manufacturers as well as all, or nearly all, outside observers have felt since the first few days that the strike could not possibly win, it seems strange that after four weeks of strike men should be returning to employment so slowly. The common if not universal theory is that the strike leaders have been bolstering up the strike by promising their representatives in the field, and the strikers themselves, that something favorable to the cause of the strike is going to come from the labor confer-

ence at Washington, which assembled when the strike had been in progress for two weeks.

It is altogether improbable, however, that there will be any action of that sort at Washington. The resolution introduced by the labor representatives, for an investigation of the steel strike by a committee of six, is probably buried. The resolution recognizing collective bargaining has had an irregular course, but it adopted it would not help the steel strike particularly.

Just how the strike leaders themselves view the strike is not known. Their claims from day to day are usually that they "are holding their own," which is not a strong claim to make, since holding their own would be quite insufficient to enable them to win the strike when they have considerably less than half the industry tied up. If they believe the reports sent them from the field they consider the strike stronger than it is, for some of the reports that the manufacturers have seen are absurd exaggerations, but it is not probable that the leaders really believe these reports. The leaders seem to be concentrating their energy in efforts to hold meetings in the Pittsburgh district. They approached Pittsburgh city council to investigate the Mayor's refusal to sanction meetings in the strike districts, but council would not take the matter up. The city administration allows meetings in certain portions of the city, where there are no strikes, but refuses to permit meetings near mills that are affected by strikes, on the ground that disorder would likely result. Through their attorney, Rubin, they approached the Sheriff of Allegheny County, who made a very vigorous reply, charging the strike leaders with preaching revolution and with being outsiders who came into the country to make trouble, and whose departure will prove very welcome.

Employment and Production

In the general Pittsburgh district in the past week each day has seen a little more employment, on the whole, at mills affected by the strike. Of men employed the great majority now are new men, there being only a few strikers. The result will be that of the mills being fully manned with some of the former employees left out. It is thought that many of the new men taking employment in the Pittsburgh district are from Youngstown and other points that are closed, or nearly closed, by the strike.

Donora and Monessen, at the head of the Monongahela Valley, the most important part of the Pittsburgh district, were closed entirely in the early part of the strike. For two weeks the mills have been open and men have been returning to work, but at a very slow rate. The large mills near the foot of the valley ran fairly well even at the height of the strike, and are doing better from week to week, but of the four largest steel mills only one is fully manned even now. The others are short by perhaps 15 per cent. on an average. Nearly all the blast furnaces attached are operating, but are not producing full tonnages. Nine Edgar Thomson blast furnaces are operating, against eight just before the strike, and three on the third day of the strike.

A fortnight ago this report gave a summary of the strike from the geographic standpoint. The strike was strong at certain detached points, including Buffalo, N.Y.; Johnstown, Pa., and Pueblo, Colo., and then there was a sharply defined strike belt dividing Western Pennsylvania, which has been running moderately well from, the west, which has been running at various rates. This belt comprised the Wheeling district, the Mahoning valley and Cleveland, making almost a continuous line north and south. There was speculation as to where in this strike belt the first marked break would occur, as everything in it was closed, blast furnaces, steel works and finishing mills. That question has been answered in the past ten days, the break occurring at Youngstown, the centre of the Mahoning Valley. The break, however, has not proved to be a sharp one by any means. There is nothing like a stampede. After the first blast furnace resumed it was fully a week before there were five operating, although there are 27 in the Mahoning Valley, and 22 of them were operating just before the strike. These furnaces operating are two of the Youngstown Sheet and Tube Company, and one each of the Republic Iron and Steel Company, Carnegie Steel Company and Brier Hill Steel Company. Each of these concerns is operating a few open-hearth furnaces in a more or less limping way, while one has a Bessemer converter in operation, and all the mills are doing a little rolling. Altogether, the production is too small to make it worth while to attempt a guess at the percentage of normal represented, but at any rate, there is a start, and the start has not been accompanied by any disorder to speak of. If there had been stronger forces available to the civic authorities for protection the return of the men would doubtless have been more rapid. As the principal works of the Carnegie Steel Company are located elsewhere, that company has trailed behind in the matter of attempting to resume, feeling that the local interests should take the lead.

Production of steel in the industry as a whole is between 55 and 60 per cent. of normal, representing a gain of only a few per cent. from the low point, probably not more than about 5 per cent. gain. Employment is somewhat greater, in point of percentage, than production, as the working forces are not well organized or balanced in the mills that are subject to strike.

CUSTOMS ARE CHANGING IN THE OLD COUNTRY MACHINE TOOL PLANTS

RALPH Williams, who has been in the machine tool department of the A. R. Williams Co., for a number of years, has just returned from an extended visit to his old home in England. He also made trips to Paris and other points on the continent.

"The machine tool builders of the Old Country are busy," stated Mr. Williams to a representative of CANADIAN MACHINERY. "I was in a large number of the shops in Birmingham, Coventry, Halifax and Wakefield, and in nearly every case they are booked up from six to twelve months in advance. In these shops they are turning out such lines as presses, turret lathes, standard lathes, radial drills, etc. Heavy machinery for shipbuilders is also greatly in demand, such as plate planers, shears, etc.

"Costs have gone up in the Old Country production the same as they have here, and in many cases more so, and there have been considerable changes made in the methods of shop practice. Many of the plants are making use of the bonus system, while it is not at all uncommon to find large English shops organized now along the same lines as the shops in United States. The unit system of construction is quite common.

"Labor conditions are not good, and production is not nearly what it should be, and for that reason the costs of machine tools are higher in England, in proportion to what they used to be, than they are in this country or United States.

"Another matter that has been taken up by the English machine tool builder is the cutting out off odd sizes and lines, and bringing his whole business down to a standard. In one shop where they used to make up around twenty classes, they are down to two. In this way they are able to re-arrange their whole works so they can get ahead on the basis of quantity production. In former times every machine that was turned out was more or less of a special proposition. This is having another effect, and that is the doing away with the general mechanic. It has been the custom in the Old Country for a long time that a mechanic should have a general knowledge of the whole field in which he worked. He could go ahead on any machine in the place and do a day's work there, and next day, if necessary, he could come in just as handy on a bench job. But that is all changing, and you find the Old Country shop specializing, so that the all-round mechanic becomes a specialist on a grinding machine, on a planer, lathe, etc."

According to Mr. Williams some of the British machine tool builders were busy now finishing up pre-war contracts at pre-war prices, on which they were sure to lose a goodly sum of money. Apparently they considered that these contracts were binding, as he instanced one case where a firm was sending out one hundred big lathes to a Japanese consignment, at a price that could not possibly represent anything like the present-day value of the tools.

The Week's Events in Montreal Industry

Roderic J. McLean, of Montreal, is expected home this week after a two months' business trip to England and Scotland.

* * *

The Hofmann-Sproul Company, of Philadelphia, Pa., are in the market for the purchase of considerable tonnage of machine shop turnings from Canadian sources.

* * *

The Canadian Ingersoll-Rand Com-Company, of Sherbrooke, P.Q., has secured the sole Canadian manufacturing and selling rights for the Wellman-Seaver-Morgan Company of Cleveland, Ohio, makers of large turbines for hydro-electric development. Machines for the Canadian market will now be made at the Sherbrooke plant.

* * *

If present plans materialize the amateur athletes among the employees of the Canadian Vickers Company of Montreal will form an organization and construct a large club house that will be provided with every modern convenience for the comfort of the members. A location as close as possible to the works will be acquired.

* * *

One of the recent enterprises for developing Canadian export trade is the formation of a corporation in London, England, known as Shawinigan Ltd. The chairman of the newly-organized company is H. T. Meldrum, of Montreal, and the vice-chairman is S. Ray Marshall, of London Howard Murray, of Montreal, is one of the directors.

* * *

The A. Bernard Industrial Company, of Fortierville, Que., have established a warehouse and service station at 36 Youville Square, Montreal, where a large stock of Bernard wood split pulleys and other power transmission supplies will be carried in stock for immediate delivery. B. Trudel & Co. will have charge of this branch and will be the authorized agents for the district.

* * *

The 1919-20 season of the Montreal branch of the Engineering Institute of Canada was opened on the evening of the 16th, at which a talk on malleable iron was given by W. G. Dauncey, C.E. The subject was ably treated by the speaker, and the fact was impressed upon the hearers that malleable iron had a distinct place in metallurgy, and should not be regarded as a rival of wrought iron, cast iron, or steel.

* * *

On Saturday of last week the "Canadian Navigator" was successfully launched from the yard of the Canadian Vickers Company. This vessel has a deadweight capacity of about 4,350 tons, and is the sixth vessel built by this company for the Canadian Government. The boat will have a length between perpendiculars of 320 feet, a beam of 44 feet, and a moulded depth of 25 feet. When the vessel has been fitted out she will take on a cargo for Liverpool.

* * *

Considerable congestion has taken place during the past few weeks in the harbor of Montreal owing to the inability of transferring the grain from the lake boats to the elevators, the latter being filled to capacity. The British labor situation has prevented regular ocean shipments, so that many vessels coming down the lakes with grain had to lie some time in port before they could get a chance to discharge their cargoes. Better conditions are looked for from now on.

* * *

A large Canadian manufacturer of air compressors states that the demand for this class of equipment at the present time is quite heavy. They state that during two weeks of September they disposed of fourteen machines, and the demand continues active. It is just recently that the inquiries for new compressors have been of any volume, as for the past year or more the trading in second-hand equipment has prevented an active market in new machines.

* * *

Unless something develops to upset the present plans for stable reconstruction work next year we can look for considerable progress in the expansion of Inter-British trade between the Mother Country and the various Dominions. Already several of these have established associations of manufacturers, to further this trade, and all the others are falling into line. One factor of after-the-war trading that is of special interest is the business of approximately $40,000,000 that Canada has done with Greece.

* * *

That steps are being taken to relieve the shortage of ocean tonnage is shown in the recent announcement of A. G. Henderson, one of the Glasgow directors of the Cunard and Anchor lines, when he stated that quite a number of vessels were now under construction for the Atlantic trade of his company. In addition to providing increased tonnage for old trade routes, the companies are preparing for other new routes as post-war requirements demand. Mr. Henderson intimated that some of these new boats would probably be ready for the Montreal route for the opening of the season of 1920.

* * *

Owing to the fact that Place D'Armes, in the heart of the business district of Montreal, is the chief transfer point of the Montreal Tramways system and frequently occasions long waits for cars, the building of a kiosk on the square is under construction. This is for the protection of the public from the inclement weather—not from the increased fares. As a matter of fact the company propose using it as a depot where the public (at least those who can afford to ride) will be able to buy tickets and get change, as the new basic rate of a 7-cent cash fare will require considerable more mental bookkeeping on the part of the tram officials.

* * *

That Canada will benefit in some of the rehabilitation of world commerce may be gathered from the activities of Timber Operators and Contractors, Ltd., a company which was organized some months ago in England by a number of officers and men of the Canadian Forestry Corps. In addition to acting as agents for Canadian timber firms, this company has acquired the Priddy and Hale plant at Rotherhithe, Surrey Docks, and are erecting a creosoting plant, and will likely erect a sash and door factory. The company is also anticipating operations in Siberia and other portions of Europe. The capital invested is two and a half million dollars, and Major Alex. McDougal, formerly general officer in command of the Canadian Forestry Corps, is president of the company.

* * *

The importance of the engineering fraternity as a national asset to the country was impressed upon the members of the Montreal Rotary Club, at their luncheon last week, when Rotarian F. S. Keith was the principal speaker. Mr. Keith dwelt on the good work that had been accomplished by the Canadian Engineers during the war, and expressed the belief that their training would enable them, if opportunity offered, to solve many problems now facing the country. In speaking of the labor unrest, he said: "The problem of capital and labor would never be solved by either one of them, nor by lawyers, because they lacked the constructive trend of mind. Nor would it be solved by the average politician, because he lacked the creative ability. The type of mind that could successfully cope with the situation was the engineer's who always worked back to first principles."

* * *

Further impetus is given to the activities of Canadian interests in the incorporation of the International Corporation of Canada, with head offices at 112 St. Francois Xavier St., Montreal, with a capital of $2,000,000. While the primary object of the company is to trade in products made by Canadian manufacturers, the scope of their activities will be world-wide, as it is their intention to establish agencies in all the principal countries of the world, not only to look after the interests of Canada but likewise to develop trade in all parts of the Empire, backed entirely by Canadian capital. The gentlemen associated with the enterprise are prominent in Canadian financial and industrial activities, and is is expected shortly that a further announcement of the names of the directors will be made. It is understood that H. B. Thomson, formerly Canadian Food Controller, will occupy an executive position with the new company.

No. 4—Inclinable Open Back Press.

Consolidated Presses

represent the highest grade in quality of material, design and workmanship, and have many exclusive features which make for economy in operation, notably the three locking points in the hubs of all flywheels, giving 20 per cent. more production than any press having only two locking points in flywheel to engage clutch.

PRESSES FOR MARKING FUSES, FOR FUSE BODIES, FOR BLANKING, CUPPING AND DRAWING CARTRIDGE CASES.

Also a general line of Punch and Inclinable Presses.

Manufactured by

The Consolidated Press Co.
HASTINGS, MICH.

U.S. SCRAP METAL

Western dealers are coming into the Eastern market, offering machine shop turnings at low prices. While in some parts the demand is active, in other business is quiet. Prices are generally firm. Following are reports from U. S. points:

Chicago.—Cast scrap, and iron and steel scrap of rolling mill grades are in good demand, and prices have shown an advance. Dealers are unable to ship stock sold on contracts owing to embargoes on shipments. Railroads are offering about 5,000 tons.

Boston.—Heavy melting steel has been bought pretty widely, and the price has advanced and continues on the up grade. Rerolling rails, stove plate, No. 1 machinery, and borings have shared in the movement. Pipe scrap shows the only drop, being quoted at $14 to dealers in Boston.

New York.—The market is quiet, though there has been some activity in heavy melting steel. Prices remain about the same, with the exception of clean cast borings, which have been advanced $1.

Philadelphia.—Western dealers who are unable to sell to their regular customers, are offering machine shop turnings at low prices in the East. A large tonnage was sold to an Eastern interest at 75 cents under the market. Wrought pipe is weak, there being no demand. Other grades are firm.

Pittsburgh.—Demand for scrap iron and steel is weak, and embargoes are preventing dealers from shipping material against contract. Dealers are looking for a better market as soon as the strike is settled.

Buffalo.—Sales are not numerous, and what there are for small lots. Prices are nominal, and there are few changes. Cast and stove plate are in good demand, and demands for borings particularly good.

Cleveland.—Trading is expected to remain quiet for some little time. There is a large amount of scrap on tracks, which will take some time to clear away when mills resume normal operations.

Cincinnati.—There is a large amount of material on stock in yards, and car shortages are operating against shipments. Steel scrap quotations are nominal, the market being very weak.

St. Louis.—Mills and foundries in this district are busy, and demand for scrap is steady. Rolling mill grades are strong. Cast scrap is about 50 cents higher.

"We're saving fuel," remarked the lady. "I just left my husband stamping on the floor to keep his feet warm."

"Thrift stamps, eh?" said her waggish friend.—Boston Transcript.

PIG IRON TRADE

Most Eastern furnaces are booked up for this year, and demand for spot iron is strong. This has led to a rise in price in some districts. Good enquiry for export iron is in evidence:

Philadelphia.—There is a good demand for prompt tonnages, a good deal of which is from New England consumers who cannot procure iron in their own district. Prices are strong, No. 2X being offered at $31 to $32 Eastern Pennsylvania furnace.

Boston.—With Buffalo furnaces practically sold up for this year's delivery, spot iron has stiffened. One or two furnaces are offering iron for first quarter, but this is the exception, and prices on this iron have advanced $1. Sales have averaged about the same as last week.

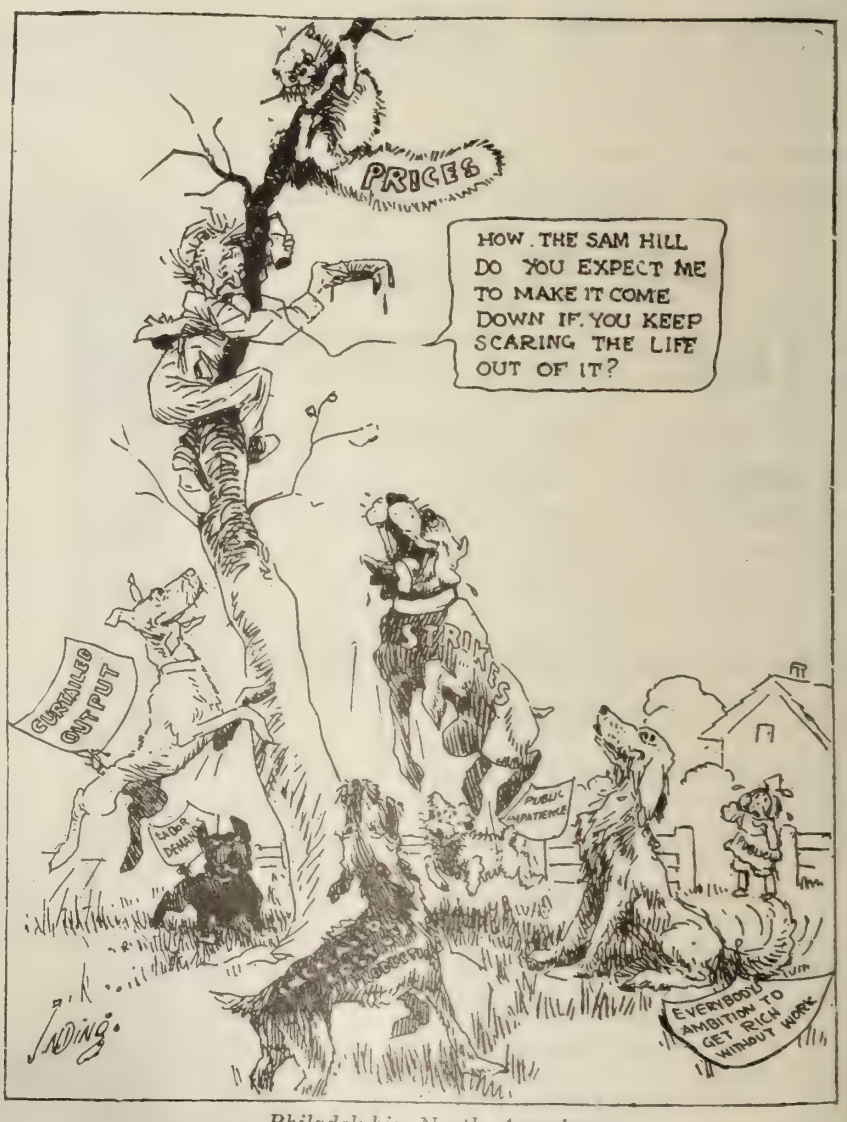
New York.—Big orders and enquiries for both basic and foundry iron for Japan have been in evidence during the week. One order for 5,000 tons basic brought up the total sales of this grade to Japanese interests in the past ten days to 10,000 tons. England, Belgium and Scandinavia are also in the market.

Pittsburgh. — Following large purchases of basic and bessemer by the Steel Corporation, amounting to probably 60,000 tons, a number of stocks have been blown in by Steel Corporation subsidiaries. Business has been small and in small lots the last few days. Carnegie has now 35 furnaces in blast, as compared with 20 during the early part of the strike.

Buffalo.—There is good enquiry in this district, but furnaces are not rushing to take orders. Some tonnage for 1920 has been booked. Prices are expected to rise after the strike is settled.

Cleveland.—The demand for spot iron from melters who are running short has resulted in stiffening prices. $30 furnace for 2.25 to 2.75 silicon has been offered, and a sale of 1,000 tons malleable at $28 Buffalo made. Steel making iron is not moving.

Call Off the Dogs



Philadelphia North American

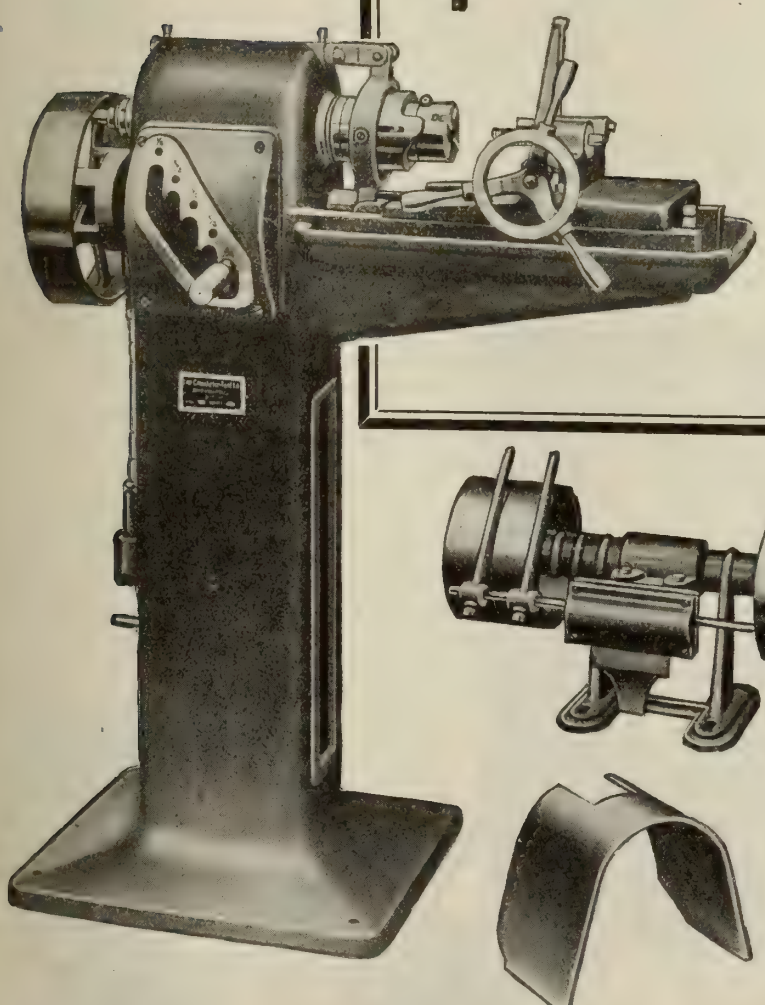
THE GEOMETRIC WAY

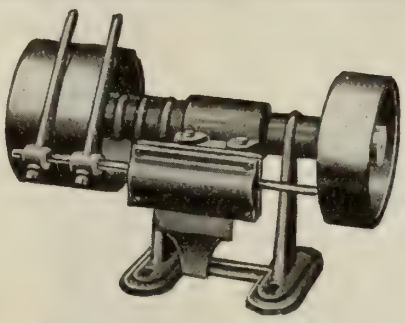
Where quantity and exactness have to be considered, the Geometric Threading Machine is just the way that suits. These machines have been tested and proved over and over again on speed, accuracy and endurance.

Geometric Threading Machines are employed on a large class of small threaded parts that cannot be produced economically on the ordinary screw machine.

Made in three sizes—to cut 1/8 to 1/2 inch, 1/4 to 3/4 inch, and 3/4 to 1 1/2 inch diameter threads. The carriage is mounted on slides and on the largest size machine is moved back and forth by rack and pinion, and in the smaller sizes by hand.

Spindle speed changes readily made, adapting the machine to the diameter and material of the work. An adjustable stop assures accurate length of thread, and automatically opens the die head, permitting of drawing the work straight back.





A line from you brings full details regarding this machine. Tell us your threading requirements—let us recommend the proper Geometric Collapsing Tap or Self-opening die.

THE MIND OF THE FOREIGNER

(Continued from page 419)

been possible for the last twenty years to hear the doctrine of capitalistic exploitation preached openly in its most vicious form, with nothing done to meet the campaign.

The politicians wanted the votes of those men wherever they could get them, and they were not going to do anything that should alienate this support.

The strikes of foreigners this year may work out for lasting good if they have the effect of making the men in charge of affairs in this country and United States get seriously to work to find out what is back of it all, and what must be done in the way of corrective propaganda.

There must be something more than mere opposition to the agitator. There must be something that will cut the ground from under his feet. Rooting out the agitator is of little use in itself, as it simply places the halo of martyrdom on his miserable head, and leaves room for another to follow in his wake.

Foreigners who are in this country have a good chance to reach a better plane of living than was ever possible for them in the land they left. In return, all that is asked is that they mind their own business and cease trying to apply Marxian nonsense to a field where conditions do not call for it. Industry has a perfect right to insist that in return for decent working and living conditions, for the absence of the sweatshop, that it be placed in a position where it can go ahead with reasonable and definite assurance that it is not going to be sand-bagged and gassed at the say-so of the agitator, whose pockets bulge with teachings of anarchy, and the easy pickings he extracts from the hard-earned surplus of his victims.

Just by Way of Suggestion

IF the farmers are going to govern Ontario, let us give them a few good suggestions. Here they be, free of charge and guaranteed strictly fresh laid:—

1. That O'Connor be banished for trying to stick a peg in the price of eggs.

2. That any person selling butter for less than $1.50 a pound be shot at sunrise.

3. That any person from the city driving a car through the country shall not exceed a speed limit of three miles an hour, and that he shall be preceded by a herald with a trumpet, a red flag and a drum.

4. That people from the farms be given the freedom of their Toronto relatives' spare bedrooms during Exhibition time, and that the custom of taking a basket of butter, eggs and chickens to such relatives be immediately done away with.

5. That the great question of "Where shall the hired man wash his feet?" be referred to the special committee on drainage and ventilation.

6. That there shall be at once added to the curriculum of all schools a course showing how to make a calf drink out of a tin pail.

Last week a note on this page told of the usual things done on Thanksgiving Day. This week a reader embellishes the page with a more elaborate diary of his day's journey:—

Got up 6 a.m.
Shaved—ate.
Took wife to station.
Went to office.
Man came in unexpectedly.
Morning work shot to pieces.
Went home.
Put up blinds.
Dug up shrubs.
Bluffed neighbor into fixing the line fence.
Moved garden swing.
Piled lumber.
Tore down fence.
Dug up post.
Filled in post hole.
Cleaned up cellar.
Played with the kids.
Ate supper.
Went four miles for junk.
Took home load of junk.
Unloaded load of junk.
Put kids to bed.
Took housekeeper and cousin for ride.
Smoked.
Yawned.
Retired tired but THANKFUL.

When Hallowe'en Comes Round

I CAN mind in days what's gone and never to return, when Hallowe'en come 'round each year our childish mind would burn, when we was told about the ride of famous Tam O'Shanter, a-tryin' to speed his old grey mare from out its Sunday canter. And we would sit with gapin' mouth—ah, yes, that tale is rich—about old Tam escapin' from the grabbin' of the witch.

But, then, in years that came along we turned to worser tricks, that savored much of cabbages, of night raids and of bricks.

And in them days we turned that night into one awful spree—in lookin' back to them there nights we'd swear it could not be. Why, I can hear John Cameron yet let out one awful roar, as we took his choicest cabbages and chucked 'em at his door.

But many of them things has passed and gone to be no more, when we was wicked youngsters in days what's gone before. And nowadays the youngsters' sport looks powerful meek and tame, the date's all right for Hallowe'en, but it hardly seems the same.

Imagine us wild-eyed galloots, when we was two-by-four, contented just to take a trip and ring at someone's door, or else to go and take a tub and duck for apples there, or gettin' taffy stuck, by gum, like glue into your hair.

Be gone the Hallowe'en that is, wheel back the good old kind, the sort that told of darin' deeds, of wild and woolly mind—when we was terrors for a night, when we shot up the block, when it took 'most a week of time to come back from the shock.

Yes, let me grab the hands of time, and grind 'em back a spell—for just pure joy at such a thing I'd bust right out an' yell. Oh, how I'd like to gather up them cabbages once more, and wave 'em up around my head, then slam 'em at the door. Old Cameron, yellin' after us, would be a joyful thing, 'twould make my heart and liver jump, and cause my bones to sing.

Of course, it's well that lots of folks don't think the same as me, but Hallowe'en, she aint the same as what she used to be.—ARK.

FROM a recent report on the subject we glean the interesting bit of information that "pseudowollastonite is the alpha form of calcium metascilicate." For our own part we'd never known before that any person could stay under water for such a long time.

A DIFFICULT PROPOSITION

Customer—"I'd like to see a suit that would fit me."

Salesman—(absently)—"So would I."

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

MARINE

Buffalo.—The longshoremen's strike in New York is making itself felt at Lake ports, embargoes being placed on flour and other merchandise for export at the head of the lakes. Ore shipments down the lake to Buffalo have fallen off considerably, and little grain is being shipped.

Midland.—The Midland Shipbuilding Company have launched their third steamer for the Imperial Munition Board from their yard at Midland. The vessel launched recently was called the "War Fury," and was a full canal sized vessel of 3,400 tons, 261 feet by 46 feet 6 inches and 23 feet depth.

Detroit.—There is considerable congestion at Detroit owing to lack of unloading facilities at other ports due to strikes and threats of strikes. Approximately 4,065,000 tons of ore were detained in the river 24 hours or more, and this week 15 big ore carriers have been held up.

The "Canadian Seigneur," of the Canadian Government Merchant Marine, sailed last Friday on her maiden trip from Montreal to Liverpool, with a full cargo of grain, pulp, newsprint, sugar, meats and lumber. The "Canadian Seigneur" was launched at Vickers on May 17 last.

Halifax.—A message from the coast of Labrador speaks of the loss of the new tern schooner, "Team 16." The vessel was recently sold by A. Moulton & Company to Hon. P. Templeman, Newfoundland. She was launched from the yard at Conquerall Bank on August 27. The crew of six were all saved, and the value is fully covered by insurance.

New Glasgow. — The "Canadian Sealer" was launched from the yards of the Nova Scotia Steel & Coal Company recently. The vessel is of the 2,800 ton class, and has an overall length of 238 feet, and 35 feet beam. A sister vessel is on the ways, and another keel was laid immediately after the "Canadian Sealer" had vacated the berth.

Sydney, N.S.—The concrete schooner being built at North Sydney by Ivan Buyley and W. N. McDonald, has now progressed to the stage where the moulds are all complete and ready for pouring. Mr. Jones, Lloyd's inspector of steamships from New Glasgow, has arrived at North Sydney for the purpose of inspecting the work done so far on the vessel.

Work May Start Again.—Work on the Welland Canal, which has been stopped for several weeks, owing to labor disputes, may be resumed in the near future. The Minister of Labor is in favor of the work being resumed this winter on account of the probable amount of unemployment, and Dr. Reid, the Minister of Railways and Canals, is going to bring the matter before the Cabinet. The decision of the Cabinet will be accepted as final.

Belleville. — The schooner "Bertha Calkins" of Picton, commanded by Captain Van Dusen and bound for Belleville from Oswego with coal, foundered near Player's Cove in a heavy gale on Sunday night. The vessel opened a seam through straining in the heavy sea. The captain brought his vessel as close as possible to the shore before she sank, and the crew all reached the land in the ship's boat. She sank in 25 feet of water, and there is not thought to be much difficulty in raising her.

New Canadian Steamship Service.—The Marine Navigation of Canada is about to establish a direct service between Canada and Brazilian ports. They are having five steamers built in Holland for the service, and these vessels will be under the Canadian flag when completed. In order to foster Canadian trade with South America a subsidiary company is being formed under the name of the Canada Import and Export Company, with offices in the Coristine Building, Montreal. The first sailing from Montreal is expected to take place before navigation closes, and sailings will be made from St. John, N.B., during the winter. The company have a service between Montreal and St. Nazaire, France, which has been in existence for some years, with two steamers.

It is announced that Mr. F. J. Buller, the popular treasurer of the Canadian National Railways at Toronto, is resigning on the 15th of the month to accept the position of vice-president and manager of the Canadian Steel Tire & Wheel Co.

This company is associated with interests that occupy a very strong position in the railway equipment field and is constructing a plant of considerable magnitude at Montreal to manufacture steel tires for locomotives and passenger equipment. This means the creation of a new and important industry for Canada. So far all steel tires have been imported.

MR. F. J. BULLER.

Mr. Buller is a well-known figure in the railway and business world. He has been in the service of the Canadian Northern and Canadian National Railways Finance Department for nearly twenty years, where he has acquired a wide connection, which will prove valuable to him in the important position to which he now succeeds.

PERSONALS

Mr. T. A. Russell, of the Willys-Overland plant, is in the Canadian West at present.

Mr. F. C. Brunke, manager of the United States Steel Products Co., Toronto, leaves this week for New York to attend the meeting of the Iron and Steel Institute, in session there.

Mr. T. A. Hollinrake, president and general manager of the A. R. Williams Machinery Co., has returned to Toronto from an extended trip through Western Canada, as far as the Pacific Coast. Mr. Hollinrake called on a number of business houses, and on his return trip came

through via Fort George and Edmonton. Taken on the whole, conditions in Western Canada are sound and satisfactory, and Mr. Hollinrake believes that there is good busiess to be done there.

Mr. M. J. Butler, a well-known figure in engineering circles in Canada, and for some years managing director of Armstrong-Whitworth of Canada, has resigned that position. From 1905 to 1910 Mr. Butler was Deputy Minister and chief engineer of the Department of Railways and Canals, when he took up the duties of general manager with the Dominion Iron and Steel Co. and Dominion Coal Co. He severed his connection with these firms in 1912 when the Canadian branch of the famous Armstrong-Whitworth Co. was formed, organizing and becoming the managing director of the new firm.

TENDERS

The Department of Public Works of Canada is asking for tenders for the reconstruction of the breakwater at Collingwood, Ont., and tenders must be delivered before November 6, 1919. Plans and form of specifications can be obtained at the office of the District Engineers Equity Building, Toronto, and at the Post Office, Collingwood, and the Department, Ottawa.

TRADE GOSSIP

The Pennsylvania Crusher Company, Philadelphia, have issued bulletin No. 1004, descriptive of their hammer crushers adapted for the fine crushing of bituminous coal.

Railway Material. — The following cablegram, dated October 7, has been received from the Canadian High Commissioner in London, England: "Egyptian State railways in market for large quantities rails, fish-plates and steel ties." The Dept. of Trade and Commerce at Ottawa may be able to furnish the particulars required.

Making Automatics.—C. R. Burt, who was for some time in charge of the Russell Motor Co. works at King and Dufferin, during the early days of making munitions, has formed a partnership with Mr. Davenport, the inventor of a number of automatic machines. Together they have purchased a plant in Rochester for the manufacture of these machines. After leaving Toronto, Mr. Burt went to the Buffalo plant of the Russell Motor Co., being very successful in carrying out the work there, and getting the contract cleaned up to the satisfaction of the Government and the company.

Holding Up Building.—The steel situation in the United States is stated to be responsible for holding up the erection of the additions to the Holmes foundry on Exmouth street, Sarnia, this fall. Construction on the addition will not begin until the spring. This will have no effect with the opening of the plant now nearing completion, which will be ready to commence work within three weeks, according to Mr. Earl, superintendent at the plant at present.

The present building has, it is estimated, two hundred tons of structural steel in its construction. The plant will extend westward as far as the railway tracks when the different buildings are completed.

New Catalogue Out.—Butterfield and Company, of Rock Island, Quebec, have just issued two new catalogues, one on twist drills, gear and milling cutters, and the other on their line of taps, dies, screw plates, and various types of reamers. In addition to the general descriptive matter on the many lines of the company, each book contains an appendix that gives many rules, formulae and tables, relating to tap and drill sizes, cutting speeds, different thread types and dimensions, and other useful information.

ST. JOHN, N.B., NOTES

The plant of the Corona Company, Ltd., chocolate manufacturers, is to be doubled in capacity. Work is now going on in connection with the enlargement.

Machinery is now being installed in the premises of the Peerless Laundry Co., Ltd., 132 City Road, which has taken over the place formerly occupied by the Maritime Glass Works.

Two large steel tanks, 42 feet in diameter, 29 feet high, each with a capacity of 280,000 gallons, are to be erected by the Crosby Molasses Co., Ltd., at their plant here. The concrete foundations are now being laid by Grant & Horne, who have the contract.

A new hardwood last factory is being completed at Mullins' Brook, N.B., near McGivney Junction, owned by an English firm, with R. T. Baird, New Brunswick, manager. A mill plant is being moved from Napadogan to carry on the manufacturing and some 200 hands will be employed to engage in the industry.

St. John, N.B., Oct. 20, 1919. — The plant of the Provincial Line Co., Ltd., near Brockville, is being rapidly restored and the company is again carrying on its production. The plant was a heavy loser by fire a few months ago. When the new work has been completed, the plant will have a capacity of some 25,000 tons.

ONTARIO INCORPORATIONS

The Industrial Financial Corporation of Canada, Limited, has been incorporated under the Ontario Act, with a capitalization of $40,000 in 8,000 shares of $5 each, to carry on the business of financial brokers, auditors, registrars, etc. The head office will be in Toronto.

Dolomite Products, Limited, has been incorporated under the Provincial Act with a capital of $100,000 in 100,000 shares of $1 each. They will carry on the business of mining, smelting and manufacturing. The head offiice to be in Toronto.

Other Incorporations Are:—Greater Hamilton Development Co., Ltd., McLagan Furniture Co., Ltd., Sky Bros., Ltd., Turner Warehouse Co., Ltd., Sudsmen's Lithographic Co., Ltd., British Saskatchewan Gold Mines Limited, Gold Centre Mines, Ltd., Hudson Parker Sales Corporation, Ltd., Hamilton Hosiery Company, Ltd, The World Mining and Reduction Co., Ltd., H. Cooke & Co., Ltd., Rapid Electrotype Ltd., Ewart, Jacob & Byam Ltd., Albion Knitting Co., Ltd., Maple Leaf Milling Co., Ltd., Bruce Mines Trap Rock Co., Ltd., Wakinda Mines Ltd., Buckham Limited.

Alice: "It's quite a secret, but I was married last week to Dick Gray."

WANTED

Representatives to handle special line of Bristol made Elastic Steam Jointing Cement (for all joints) and Iron Cement for casting, etc. Exclusive territory offered parties conversant with trade. Replies treated confidential. Apply Box 633, Canadian Machinery. (c.t.f.m.)

Wanted

A firm of Canadian engineers to manufacture and sell on royalty basis a hand-operated stoker. This is an established appliance, and is the ideal installation for the small plant, where investment cost is an important item. Combustion principles are same as on highest priced automatic stokers. The ideal stoker for the Canadian market, where the one boiler plant is in the majority. Write to Box 632, Canadian Machinery, 143 University Ave., Toronto, Canada.

Wanted by manufacturer of mechanical hot blast heater, good, live agent to represent them in Canada, one calling on foundries and machine shops preferred. Good proposition to right party. Splendid co-operation will be given. Apply Box RG, Canadian Machinery.

PATENTS FOR SALE

Two Canadian Patented Steam Specialties for sale; one Steam Trap, Patent Number 187215, and one Steam Separator, Patent Number 183340.

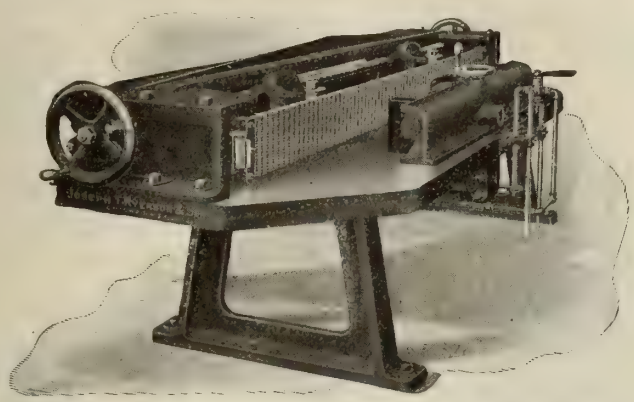
Allentown Experimental Works

Allentown, Pa., U.S.A.

RYERSON

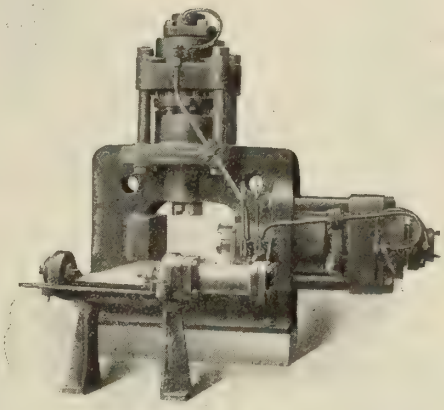
Spring Shop Machinery

We manufacture a complete line of machinery for the railroad spring manufacturing and repair shops. We will furnish upon request plans and layout of a modern spring shop. Write for complete descriptive bulletin on each machine.



Ryerson Universal Elliptic Spring Forming Machine

This machine will form elliptic spring leaves of any size and curvature used in ordinary practice requiring but one spring maker for its operation.

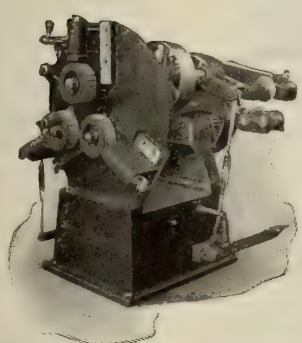


Triple-Pressure Hydraulic Spring Banding Press

This machine is of the triple pressure type capable of exerting a maximum pressure of 100 tons and with minimum and intermediate pressure of 33 and 67 tons.

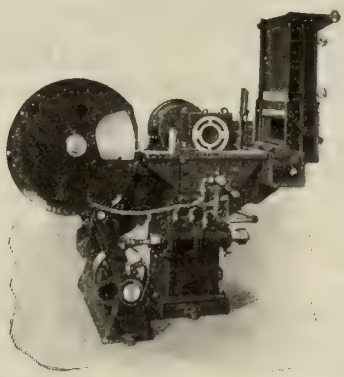
Flue Shop Equipment

We manufacture a complete line of machinery for cleaning and repairing boiler flues and will furnish upon request layout of a modern flue shop.



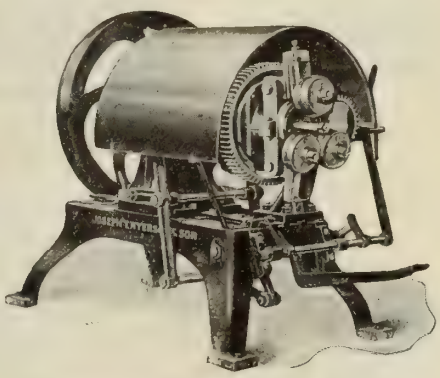
Ryerson Improved Universal Flue Cleaning Machine

This machine will clean and cut tubes, both standard and superheater sizes.



Ryerson Combination Hot Saw and Tube Expander

This machine is built in both standard and superheater sizes and will handle three operations in the repair of boiler tubes.



Hartz Superheater Tube Welding Machine

This machine will handle either standard or superheater tubes with equal facility and economy.

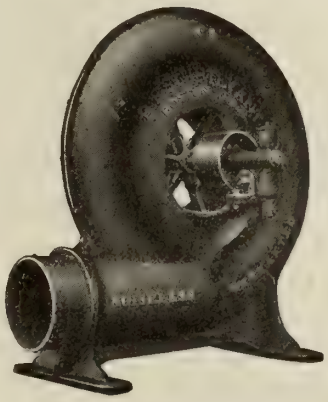
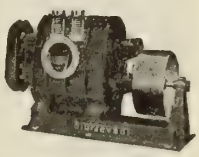
Medium Pressure Blower



Low Pressure Blower



High Pressure Blower

For All Purposes

THO designed originally for supplying air to cupolas and forges Sturtevant steel pressure blowers are now used for all purposes where pressures up to 16 ounces to the square inch are to be maintained; and where air is to be forced for long distances. Regularly built with horizontal discharge but can be readily made for down blast or up blast. Built in all sizes and may be belt, motor, engine, or turbine driven. Operating and upkeep cost is remarkably low as proven by actual performance in many long term (30 years and more) installations. Design and construction are typically Sturtevant—supreme! Blast wheel is made of refined steel and galvanized to prevent rust. Wheels are accurately balanced and run smoothly when driven at high speed. Bearings are each cast in one piece and are lined with highly durable non-heating white metal. Write for catalogue.

Is the Alien a Menace?

IN the October issue of MACLEAN'S MAGAZINE a strong presentation is made of the reason why the people of the West are against further foreign immigration.

"The Menace of the Alien" depicts the foreign problem in the Canadian West as it exists to-day, and shows every one of us why we must Canadianize our Ruthenians, Austrians, Slovaks, and our fifty-seven other varieties before we allow any further "unrestricted" immigration.

This article is written by a member of MACLEAN'S MAGAZINE staff who has just returned from a careful, personal investigation of the situation. Shall we have a "White West?" Many Westerners are demanding it. Are the aliens to swing labor into the bosom of the O.B.U.? It is being done—and what must we do to stop it?

The "inside" story of the routing of the Drumheller miner aliens by returned Canadian war veterans is here told by MACLEAN'S for the first time. What leadership must be substituted for the O.B.U. leadership of these foreigners?

The October issue of MACLEAN'S is a Western number in the sense that it contains many articles and stories of distinctly Western interest. For instance:

X "Those Pesky Farmers Out West"

By Hopkins Moorhouse, Author of "Deep Furrows"

They have completely upset the old order of things. No longer will politics consist of the comfortable fight between the Ins and Outs with the old party lines maintained. The grain growers on the Prairies have upset the calculations of the professional politicians and completely changed the face of Dominion politics.

X "Fifty Years in the West"

By Professor W. T. Allison

A breezy and readable sketch of the business career of Winnipeg's veteran business man, James H. Ashdown.

"Further Discoveries of New Land"

By Vilhjalmur Stefansson

The final and most interesting instalment of Mr. Stefansson's story of his wonderful trip of five years' duration in the Canadian north in which he tells for the first time of finding new continents in the Arctic and hoisting there the Canadian flag.

X "The Banshee Bell"

By Edith G. Bayne

A bright love story laid in the mountains of British Columbia.

Other Splendid Features of October MacLean's

X "The Turmoil at Ottawa"

By J. K. Munro

A comprehensive survey of Dominion politics, written with complete impartiality and absolute candor. It is bright and breezy, with a knock in every line for the politicial opportunists. It plucks many tail feathers from our party leaders.

"Spanish Doubloons"

By Camilla Kenyon

The start of a bright and fascinating serial story by a brilliant young writer. It is the Spanish Main brought up-to-date, treasure hunting with a background of fun and romance.

"The Airy Prince"

By Arthur Beverley Baxter

A complete novelette in which is presented a bird's-eye view of England in time of war. It is one of the most brilliant stories that has been written of recent years.

"His Majesty's Well-Beloved"

By Baroness Orczy

The latest novel by this popular authoress appearing exclusively in MACLEAN'S.

"Ebb and Flow"

By C. W. Stephens

A strong business story laid in the province of Quebec.

Over 70,000 Canadian Families Buy

"The Marshalltown Throatless Shears"

guarantees perfect work at less than half the ordinary expense.

Rotary, self-feeding shears designed for cutting in and out curves, straight or irregular shearing, circles, also beveling and splitting of plates. Built in various sizes having capacities from tin up to ½" thick. No limit to the size of sheet being cut. Hand, belt or motor drives. The last word in metal cutting shears. We also manufacture Rotary Bevel Shears, Splitting Shears and Plate Milling Machines.

Let us know your requirements.

Marshalltown Mfg. Co.

Marshalltown, Iowa
U. S. A.

Would you like to have us prove that

Peerless HIGH SPEED

Machines do 50 to 100% more work

The Peerless has established a new standard of production in so many plants that we are ready to ship one at our expense and risk, if you agree to give it a thorough test. A trial like this often results in our selling from 1 to 10 machines.

The Balance Lift of the Peerless

automatically raises the blade for the return stroke. This greatly prolongs the life of the blades, economizes power, and increases production. There are more good features which we shall be glad to acquaint you with.

The Peerless assures you the peak of production at very lowest cost. Write for full details.

PEERLESS MACHINE CO.

1607 RACINE STREET RACINE, WISCONSIN

"SAFETY FIRST"

Bend the Spout

to suit the position

Every requirement satisfactorily met with

ALL-WAY OILERS

Note the flexible spout. It enables you to oil all places—many places that previously could only be reached with force pump cans with specially bent spouts.

Indispensable to those who know. Will last as long as six ordinary oil cans. Saves 50% of oil bills.

Ask your dealer to show you the complete ALL-WAY line of oilers. If he canot do so, please write to us.

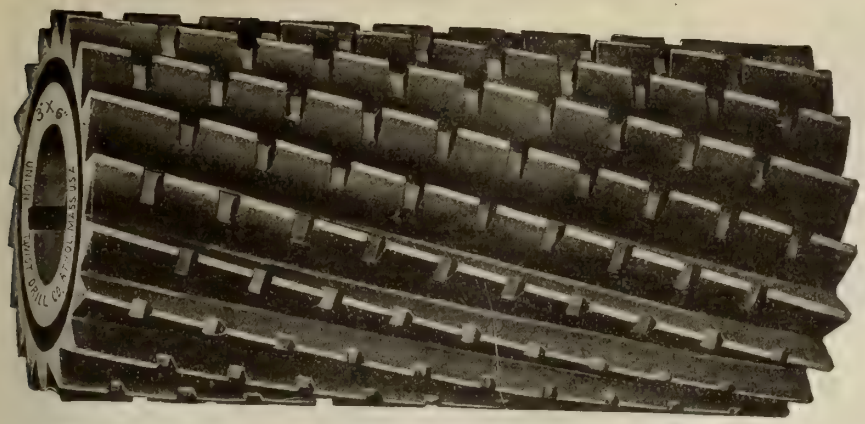
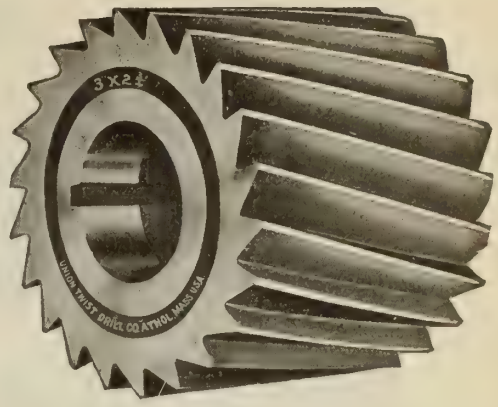
Blount Pattern-makers' Lathe

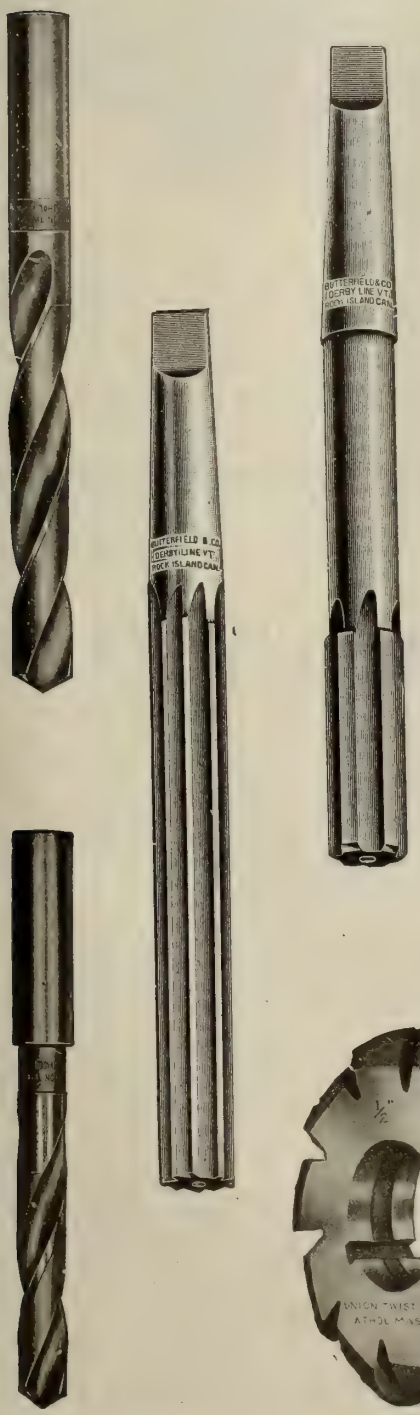
FAST AND ACCURATE—Equipped with set over swivel tailstock and carriage, and outside face plate and tripod. Built in 16" swing with beds 6 or 8 feet in length. Spindle is made of high carbon steel, is hollow and fitted with Morse Taper and runs on self-oiling bronze bearings.
Our catalog gives a full description of this strong and highly efficient machine, also our other quality speed lathes and grinders. Give us your address.

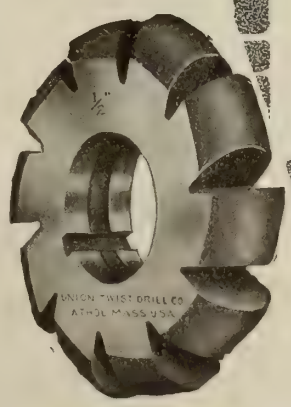
J. G. BLOUNT COMPANY
EVERETT, MASS., U.S.A.

If what you need is not advertised, consult our Buyers' Directory and write advertisers listed under proper heading.









BUTTERFIELD

TWIST DRILLS GEAR AND MILLING CUTTERS

(Carbon and High Speed Steel)

It will pay every manufacturer, who is not acquainted with Butterfield Tools, to measure their quality by the test of long, hard SERVICE.

You'll find the Butterfield durability the key to tool economy.

Drop us a line for catalogue.

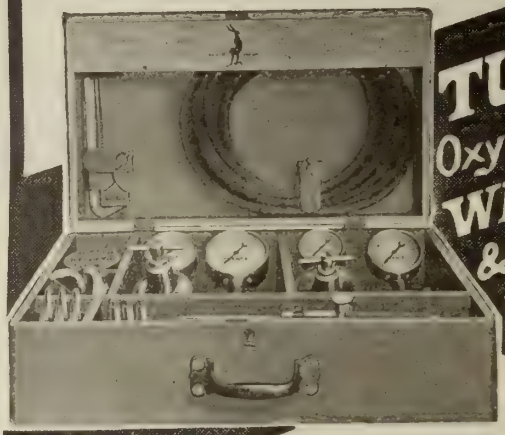
For Repairing Broken Machinery or Tools of Medium Size



TURNER Oxy-Acetylene WELDING & CUTTING Equipment

These outfits will soon pay their cost in machine parts or tools reclaimed. The sectional extensions of the torch enable the operator to adjust it to any desired length or angle. The location of valves is such that the flame is controlled by one hand, leaving the other hand free for the work at all times.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

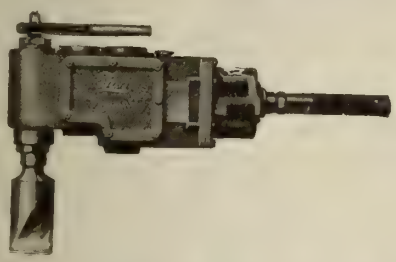
Thor

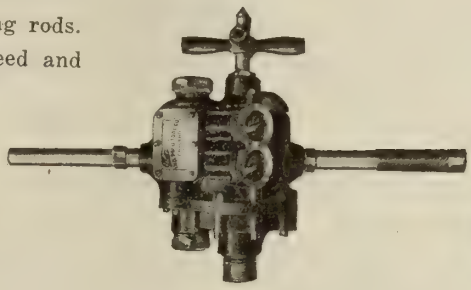
Pneumatic DRILLS and Hammers

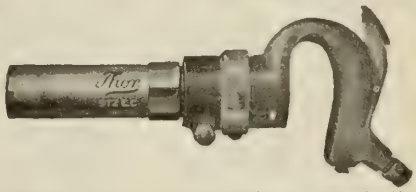
There is a Thor Tool made especially for your work. Try it—and watch it save you time and labor and increase your production.

Thor are the only air drills made in America having Corliss valves, roller bearings, and one-piece pressed Vanadium steel connecting rods. Also equipped with telescopic screw-feed and removable crank chamber plate.

No. 32-L Reversible Compound Piston Air Drill driving ¾-inch studs in Motor Crank cases.







For full particulars write—

Twenty years of knowing how built into each Thor Tool you buy.

INDEPENDENT PNEUMATIC TOOL COMPANY

334 St. James Street, Montreal, Que.

TORONTO: 32 Front St. W. **WINNIPEG: 123 Bannatyne Ave. E.** **VANCOUVER: 1142 Homer St.**

Cleveland Sand Rammers

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts — Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

Sand rammer in operation.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Standard Equipment Everywhere

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock:—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Write for Bulletins, 34A, 41 and 43.

For Self-Promotion And Sales Promotion

Are you interested in any of these fields—power—metal working—marine? As a manufacturer, or purchasing agent, as a superintendent or foreman, as an ambitious mechanic or engineer?

Use These Publications

They will keep you strictly up-to-date in all branches of mechanical engineering. Edited by practical men. Cheerful, inviting, instructive, authoritative.

POWER HOUSE

Twice a month — $1.00 per year now — $2.00 January 1.
Serves the power plant engineer—Steam, Electric Refrigeration, Hydraulic.

CANADIAN MACHINERY

Weekly—$3.00 per year.
Covers the metal working field—serving shop executives, purchasing agents and owners. First-class mechanical paper and market paper combined.

CANADIAN FOUNDRYMAN

Monthly—$1.00 per year.
A paper for the foundry owners, superintendent and foreman. Claimed by its readers to be unexcelled.

MARINE ENGINEERING

Monthly—$2.00 per year.
Interprets marine engineering in its broad sense, serving the shipbuilders, navigation companies and their officers. (The editor holds an extra first-class B.O.T. certificate.)

Published by

THE MACLEAN PUBLISHING CO., LIMITED

143-153 UNIVERSITY AVE., TORONTO

A company whose idea of service has made it the largest concern of its kind in the British Empire.

Thirty years' experience and dozens of practical men in your own line, stand ready to serve you. Let them! Subscribe for **your** paper to-day.

Men with selling problems will find a profitable tip in the statement made by a prominent manufacturer recently, "I use MacLean Publications because I am satisfied that papers with such a high standard of editorial excellence, **MUST** have an influential following."

MULTI-DRILLERS NATCO MULTI-TAPPERS

"Very Satisfactory"—

Says Mr. Mooney of the Canadian Westinghouse Co.

Consider the fact that this NATCO has been in service but a short time, that it is already drilling 640 holes in an hour, and you get a better idea of what this "very satisfactory" endorsement means. For while the NATCO is comparatively easy to operate, it is nevertheless true that output increases as the operator becomes thoroughly familiar with the NATCO.

Before Drilling

After Drilling

Forty-four holes, 25/32 inch in diameter and varying from 1 to 2 inches in depth, are drilled into 15 of these cast iron Centerpieces and Cylinders every hour. Even if the holes were of widely varying diameters the NATCO would still drill them all in two operations (22 holes on each side). In fact, the NATCO patented multi-speed feature provides the proper cutting speed for each size tool so that tapping, reaming, counterboring, etc., on different size holes becomes one operation.

Built in 11 sizes, ranging from 2 to 72 spindles, NATCOS can bring proportionate results on widely different work.

Send us blueprints and we will furnish you production estimates—gratis

We also design and build jigs and fixtures for use in connection with NATCO Multi-Drillers.

The National Automatic Tool Company

Richmond, Indiana, U.S.A.

List of NATCO foreign agents

Burton, Griffiths & Co., British Isles; E. Isbecque Co., Belgium; Aux Forges De Vulcain, France; Allied Machinery Co. of America, Italy, Spain, Portugal and Switzerland.

Tycos Fever Thermometers.
Tycos Sphygmomanometers.
Thermometers of all kinds for home and general use.

Having won their superior position by painstaking and exact service in innumerable industrial applications. They do their work well, perform every duty demanded of them in temperature problems efficiently. The large number of satisfied users is ample indication of the confidence they repose in *Tycos* products.

Tycos is the answer to your Temperature Problems

Tell us what your temperature taking requirements are and let us send specific information. Perhaps you can refer to our catalogues—are they on your files?
